

# Measurement of air shower maxima and p-Air cross section with the Telescope Array

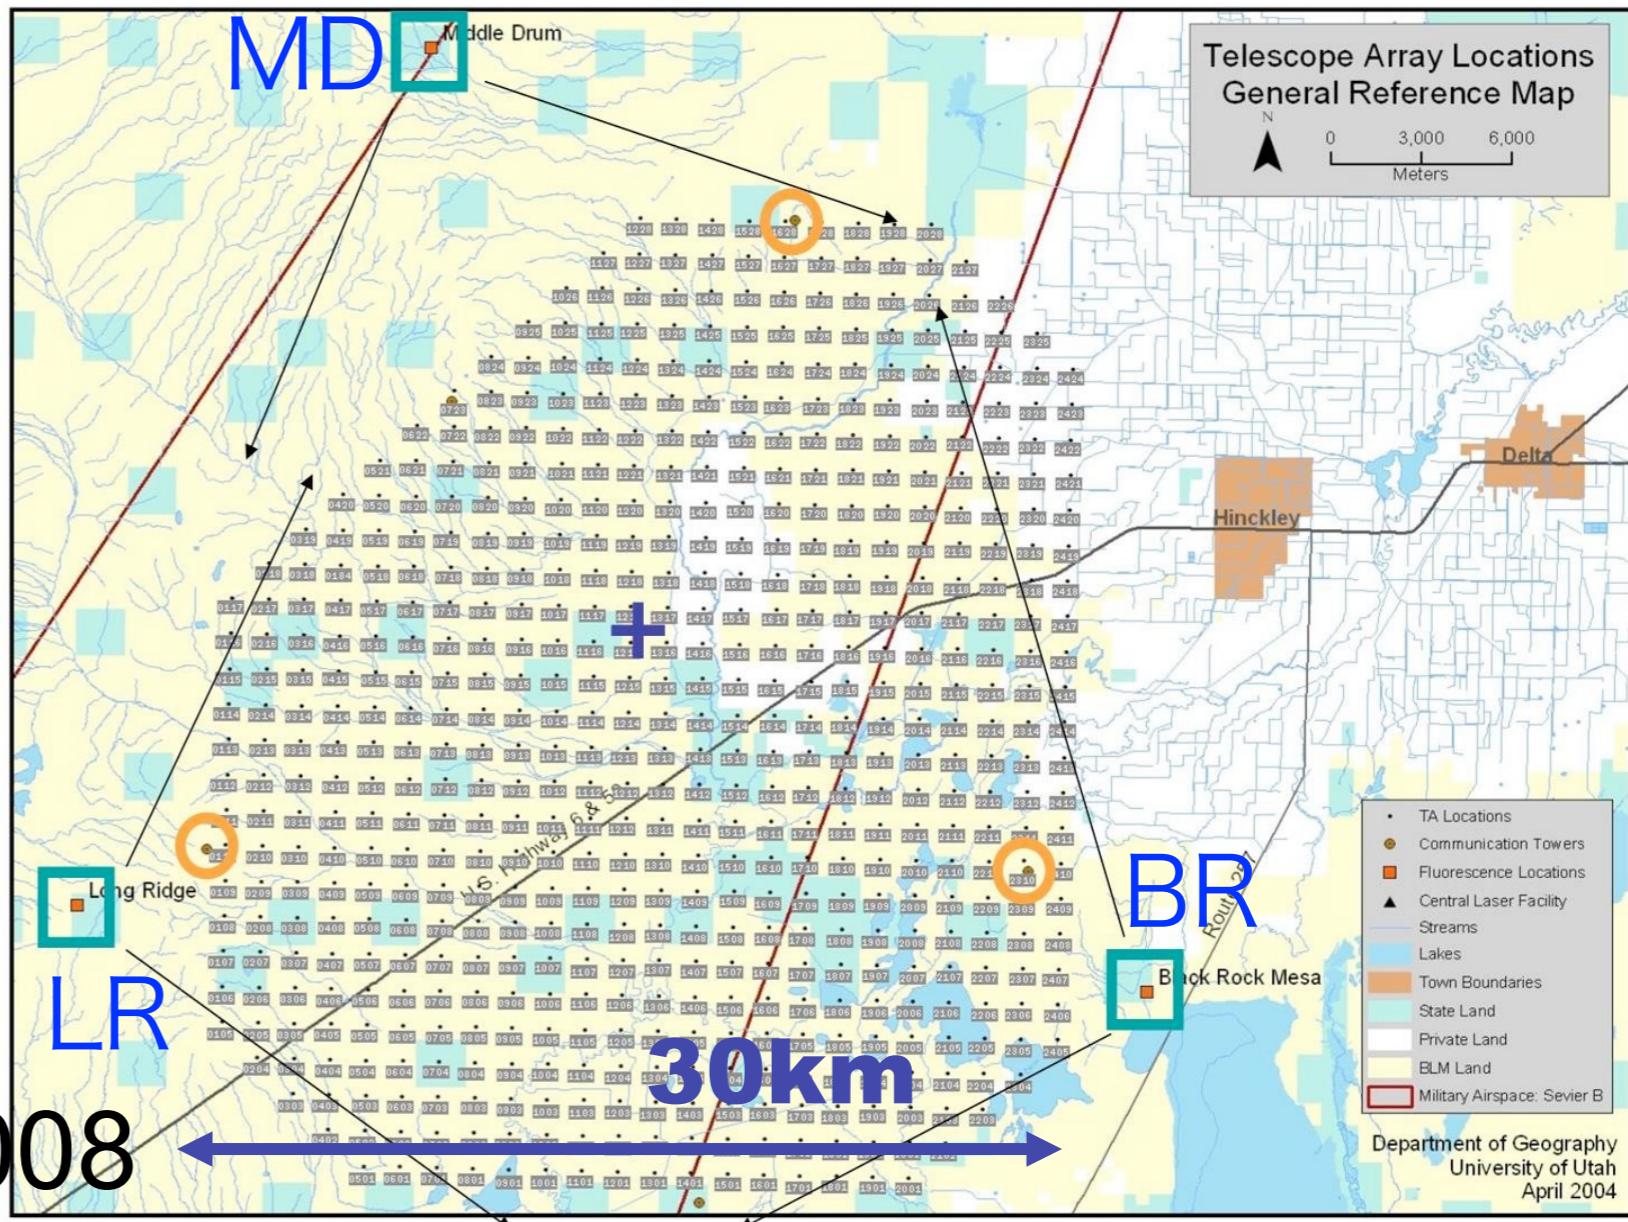

**Yoshiki Tsunesada**

Graduate School of Science,  
Osaka City University

May 18 2016  
QCD At Cosmic Energies VII, Χαλκίδα, Greece

# Telescope Array

- Cosmic ray observatory in Millard county, Utah, the US
  - US, Japan, Russia, Korea, and Belgium
  - Surface detectors (SDs): 507 scintillation counters
  - Fluorescence detectors (FDs): 38 telescopes in 3 stations
  - 700km<sup>2</sup>
- Operation since 2008

# UHECR: Early Spectra

*AGASA (~2004) and HiRes Fly's Eye (~2006) experiments*

## AGASA

JP: Surface detector array, 111 counters,  $\sim 100\text{km}^2$

- Energy spectrum extends  $> 10^{20}\text{eV}$  without a cutoff

M.Takeda *et al.*, Phys.Rev.Lett., 81, 63 (1998)

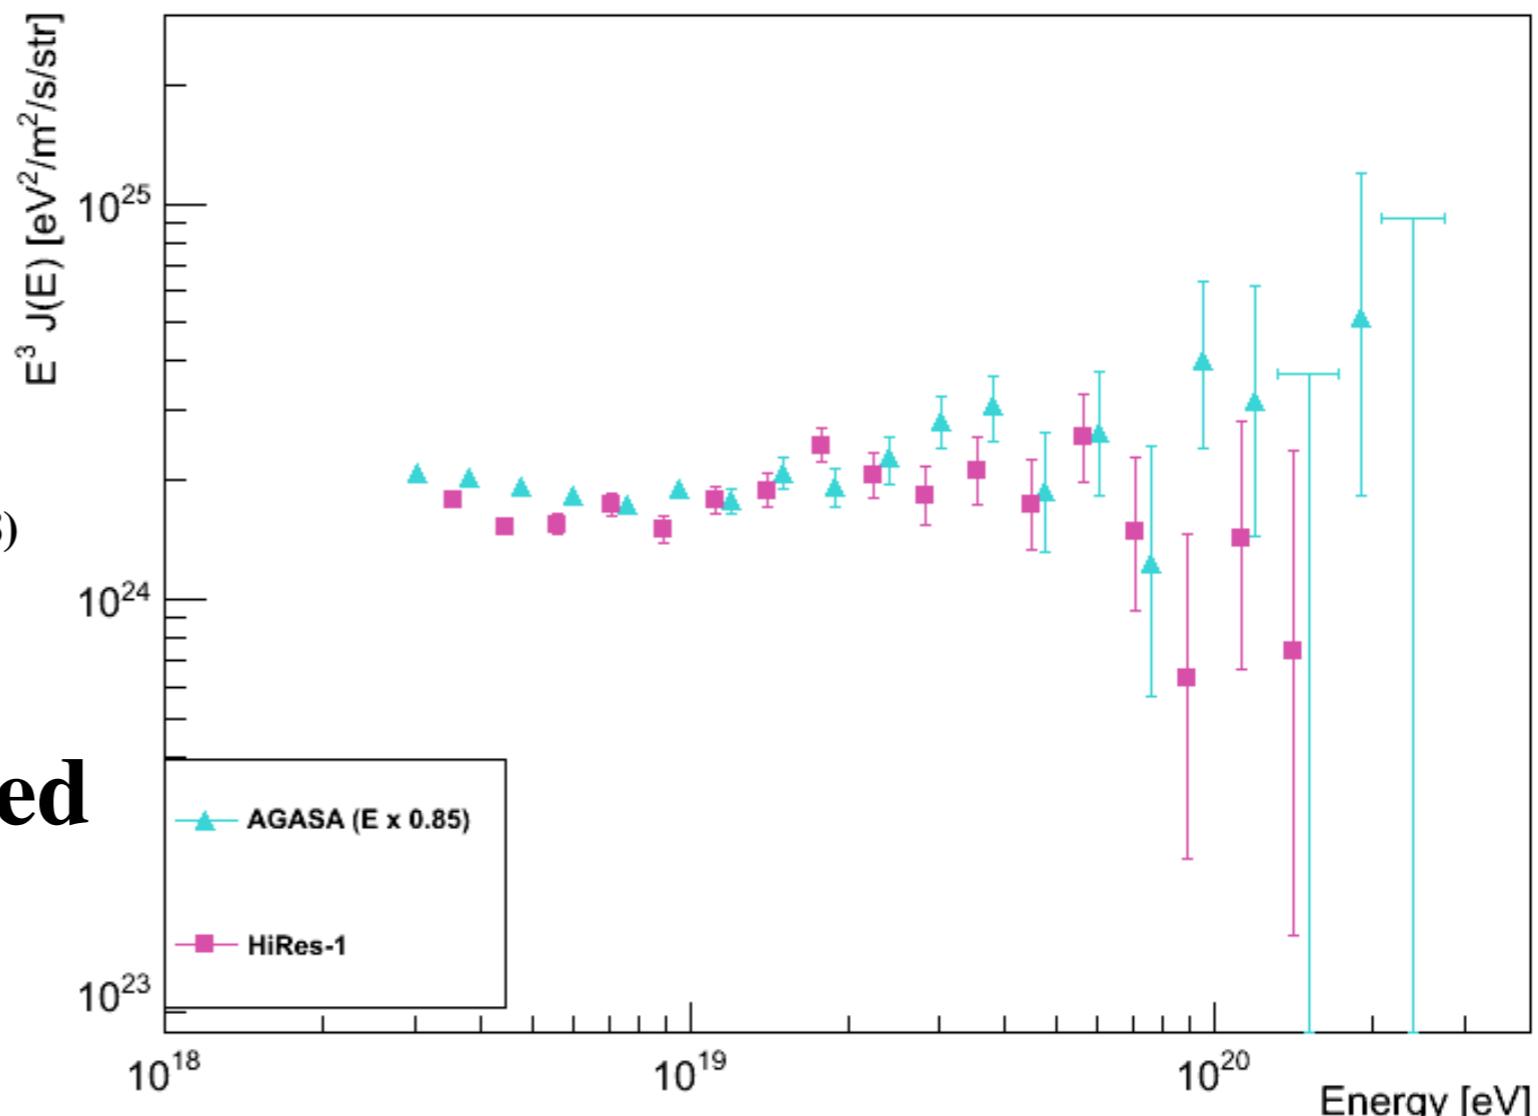

## HiRes

US: Fluorescence detectors

- There *exists* a cutoff

Phys. Rev. Lett. 100 101101 (2008)

Different techniques resulted  
in different conclusions?

# UHECR: Early Spectra

*AGASA (~2004) and HiRes Fly's Eye (~2006) experiments*

## AGASA

JP: Surface detector array, 111 counters,  $\sim 100\text{km}^2$

- Energy spectrum extends  $> 10^{20}\text{eV}$  without a cutoff

M.Takeda *et al.*, Phys.Rev.Lett., 81, 63 (1998)

- *How do we understand?*

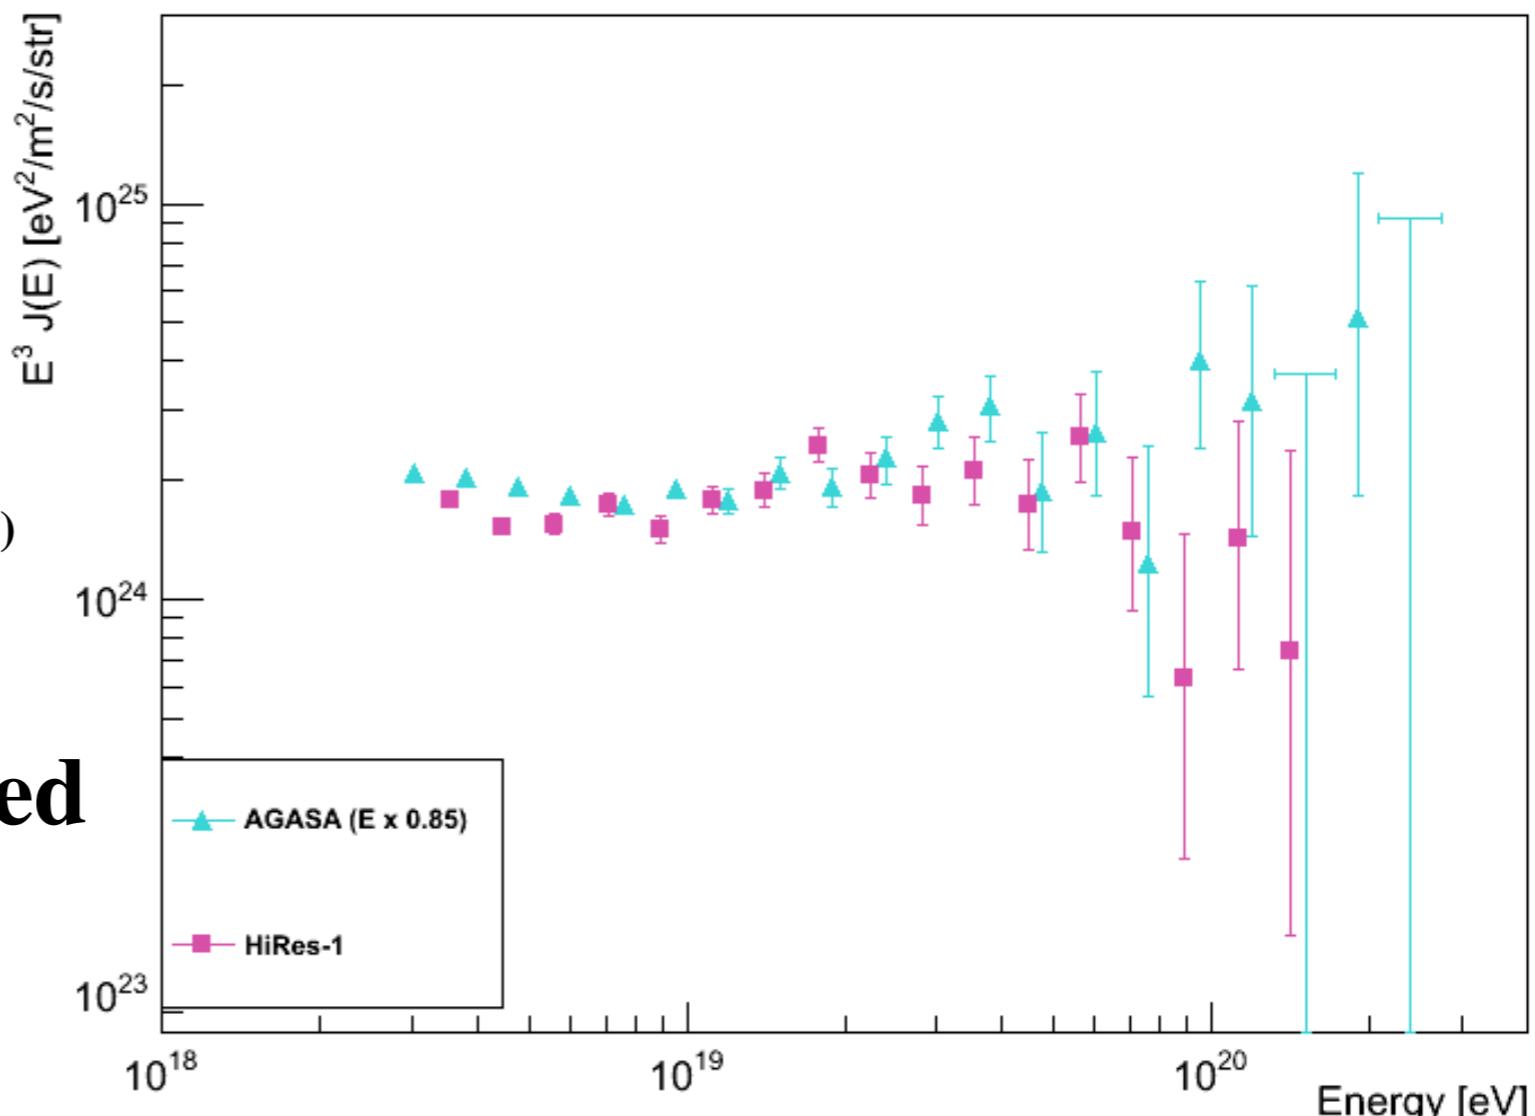

- *Violation of Lorentz invariance?*
- *Topological defect?*
- *New physics? So exciting!?*

## HiRes

US: Fluorescence detectors

- There *exists* a cutoff

Phys. Rev. Lett. 100 101101 (2008)

Different techniques resulted  
in different conclusions?

# TA Surface Detectors

1.2km grid

507 Scintillation counters  
in  $700\text{km}^2$

(AGASA: 100 scintillators in  $100\text{km}^2$ ,  
Auger: 1600 water tanks in  $3000\text{km}^2$ )

# TA Fluorescence Detectors

Refurbished  
from HiRes-I

Observations  
since ~10/2007

New FDs

Observation  
since  
~11/2007

Long Ridge

Observation  
since ~6/2007

6.8 m²

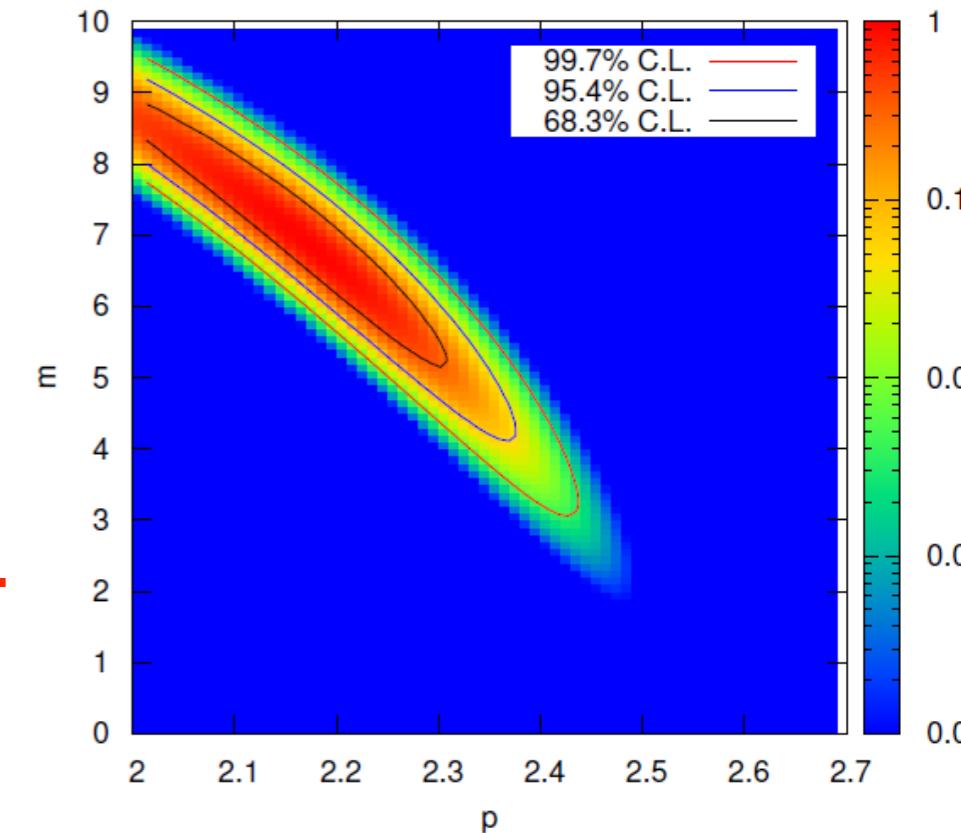

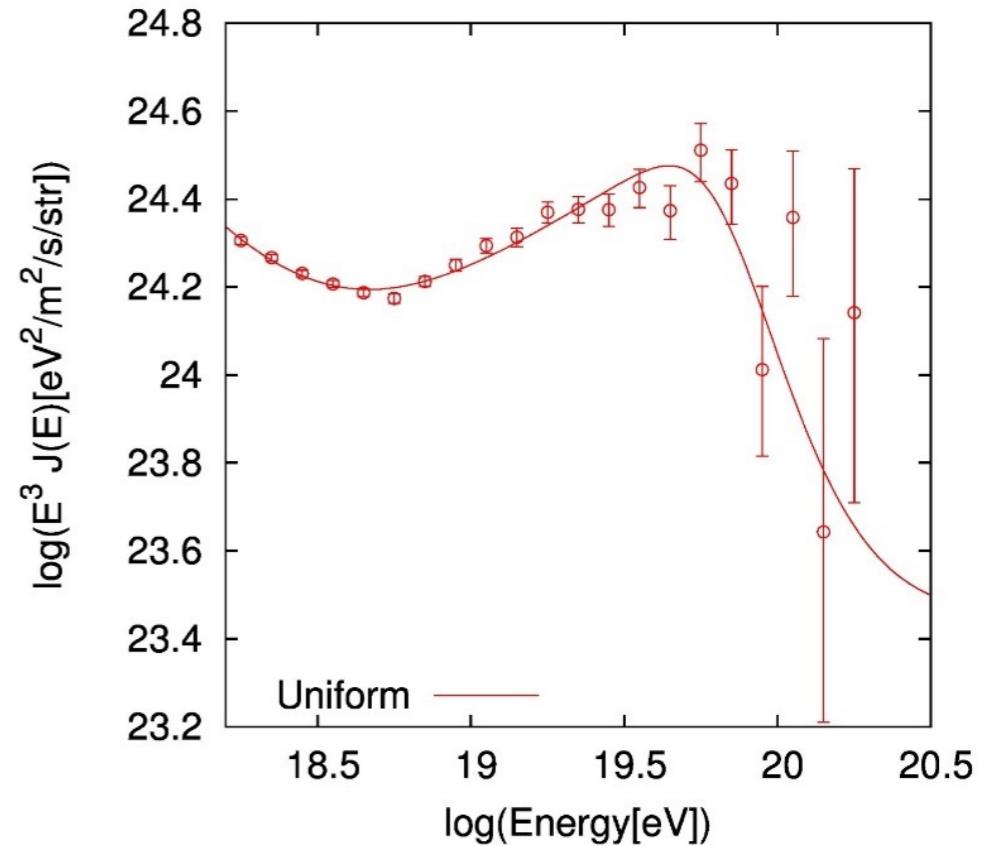

# TA 7-Year Energy Spectrum

# Fitting the TA Spectrum to a “Minimal Cosmological Model”

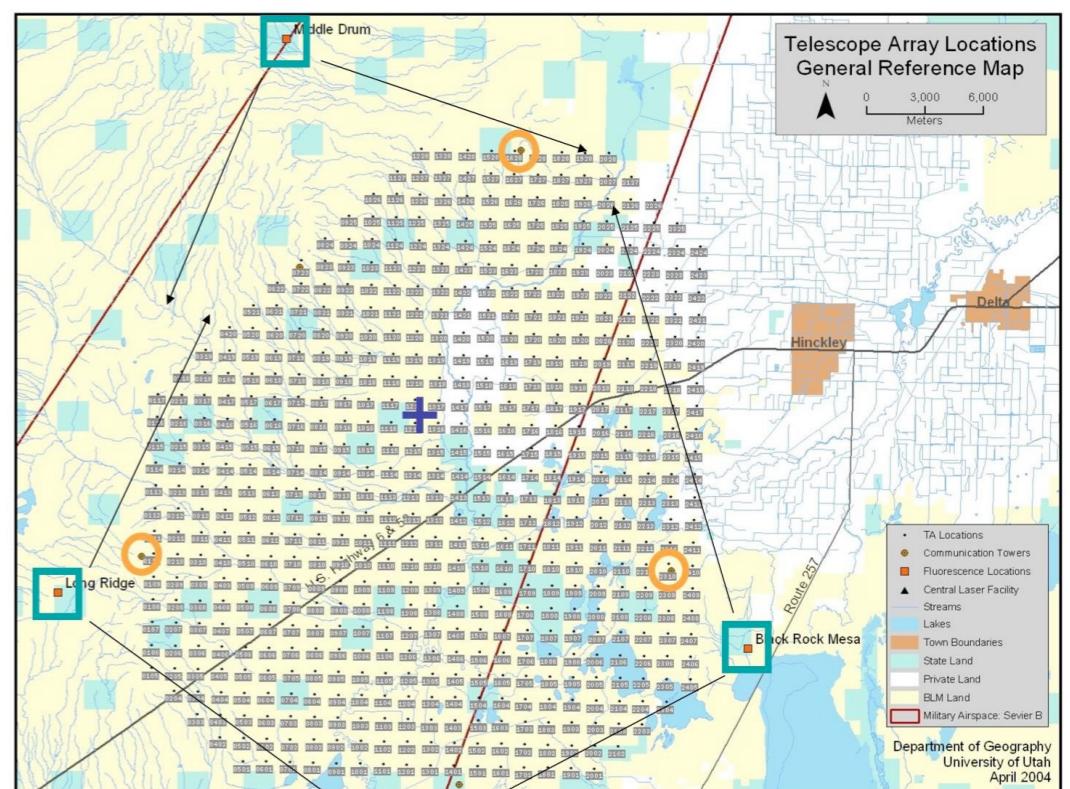

- Physical processes:
  - Proton
  - Photo-pion production
  - e-pair production
  - Hubble expansion
  - Isotropic distribution of sources of equal intensities
- Fit parameters:
  - Power-law index at the sources  $E^{-p}$
  - Cosmological evolution  $(1+z)^m$

Based on the assumption of pure-proton CRs.  
What is the CR composition at the highest  
energies?

# TA <math>\langle X\_{\max} \rangle</math> Analyses

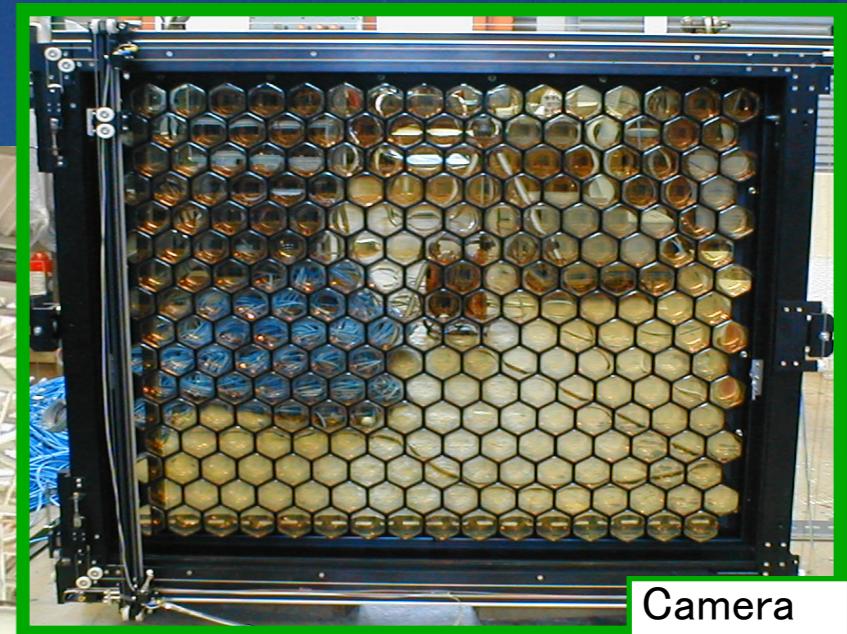

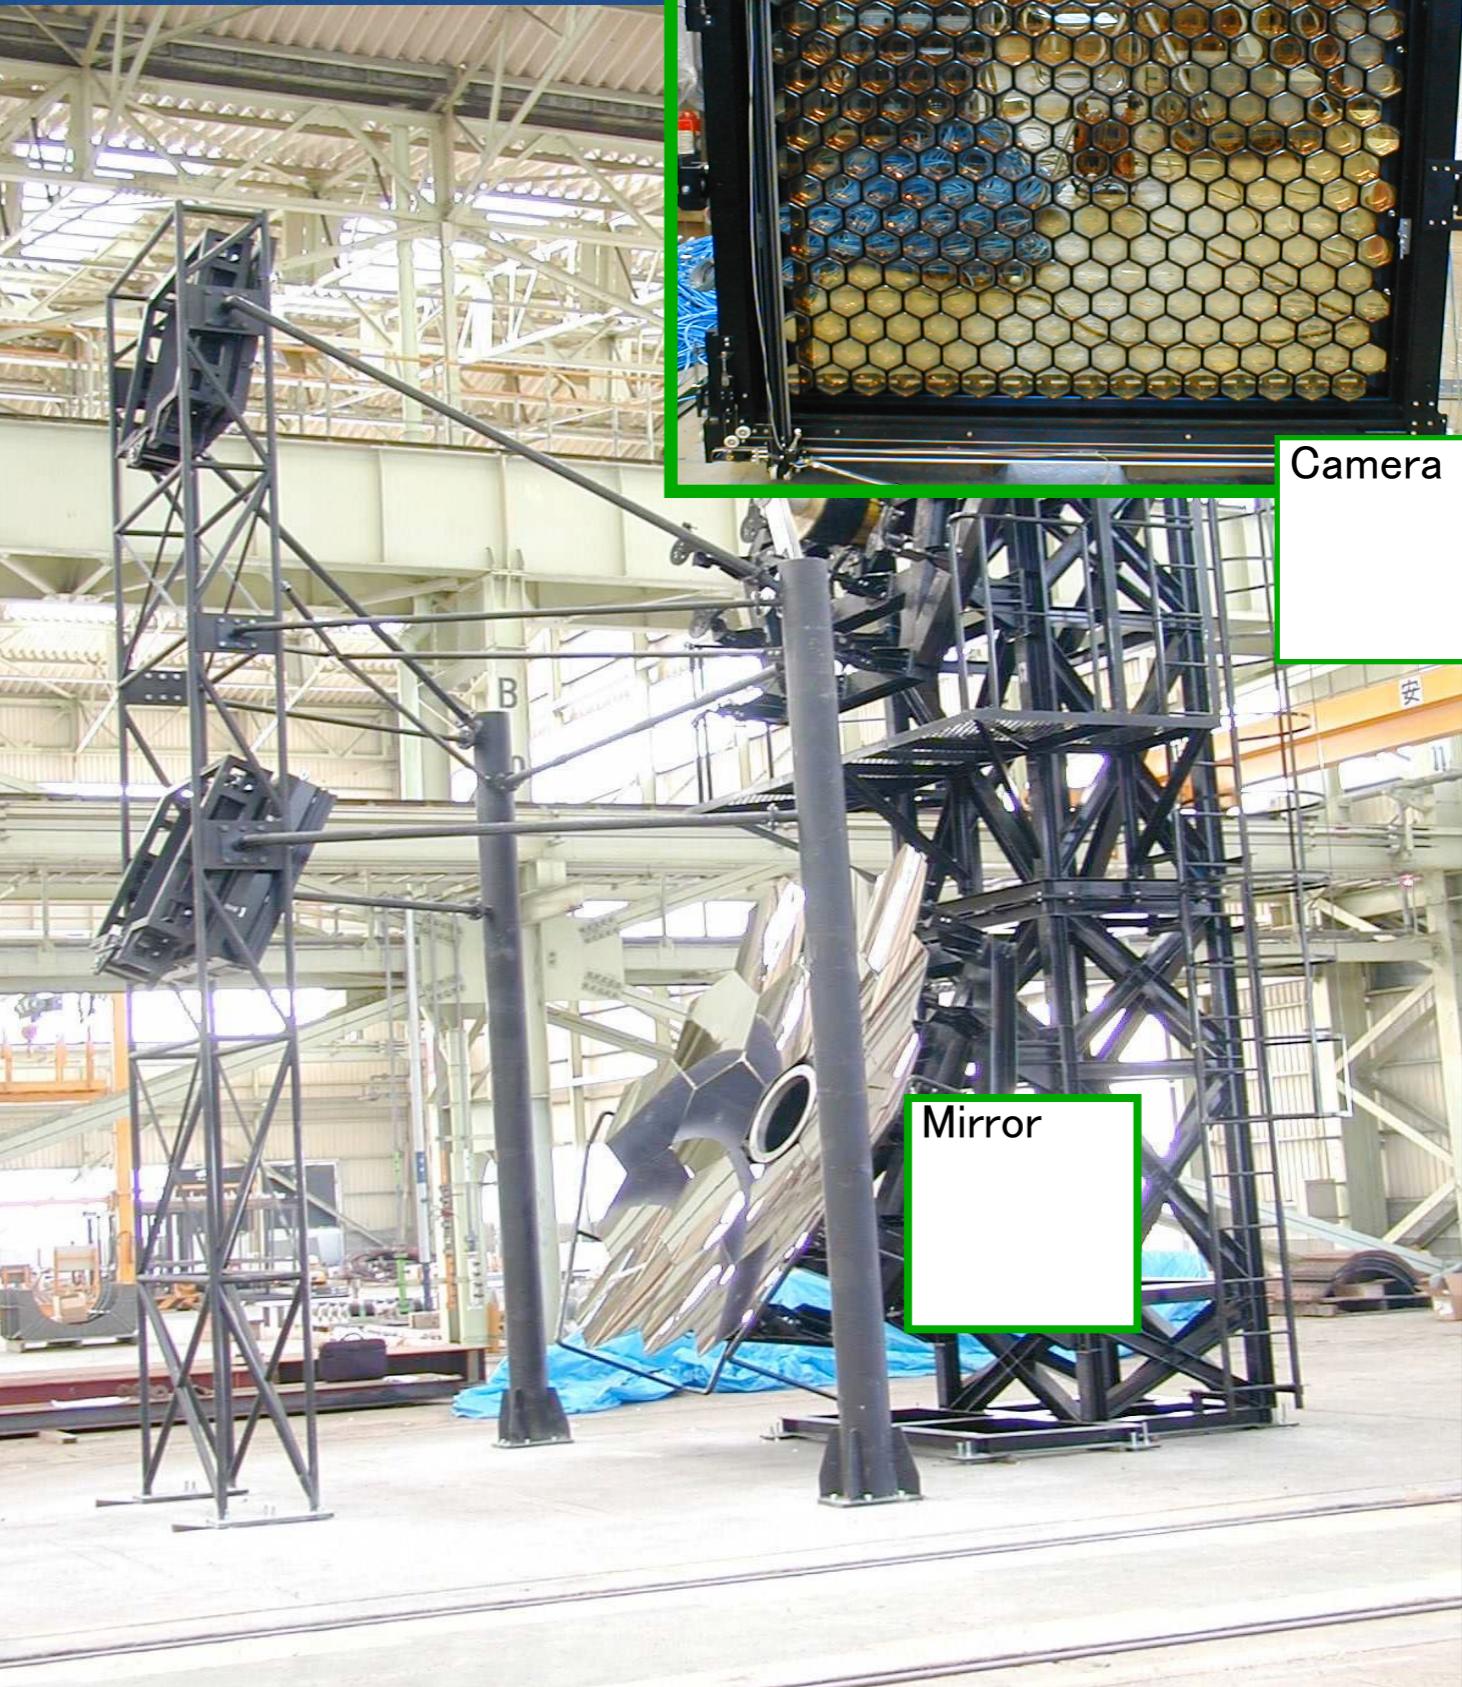

- Use fluorescence detectors
- Two analyses in parallel
  - MD(HiRes-I)
  - BR/LR
- Independent analyses by subgroups in the collaboration using the same data
  - Systematic check
- $X_{\max}$  resolution and systematic uncertainty  $\sim 20 \text{ g/cm}^2$

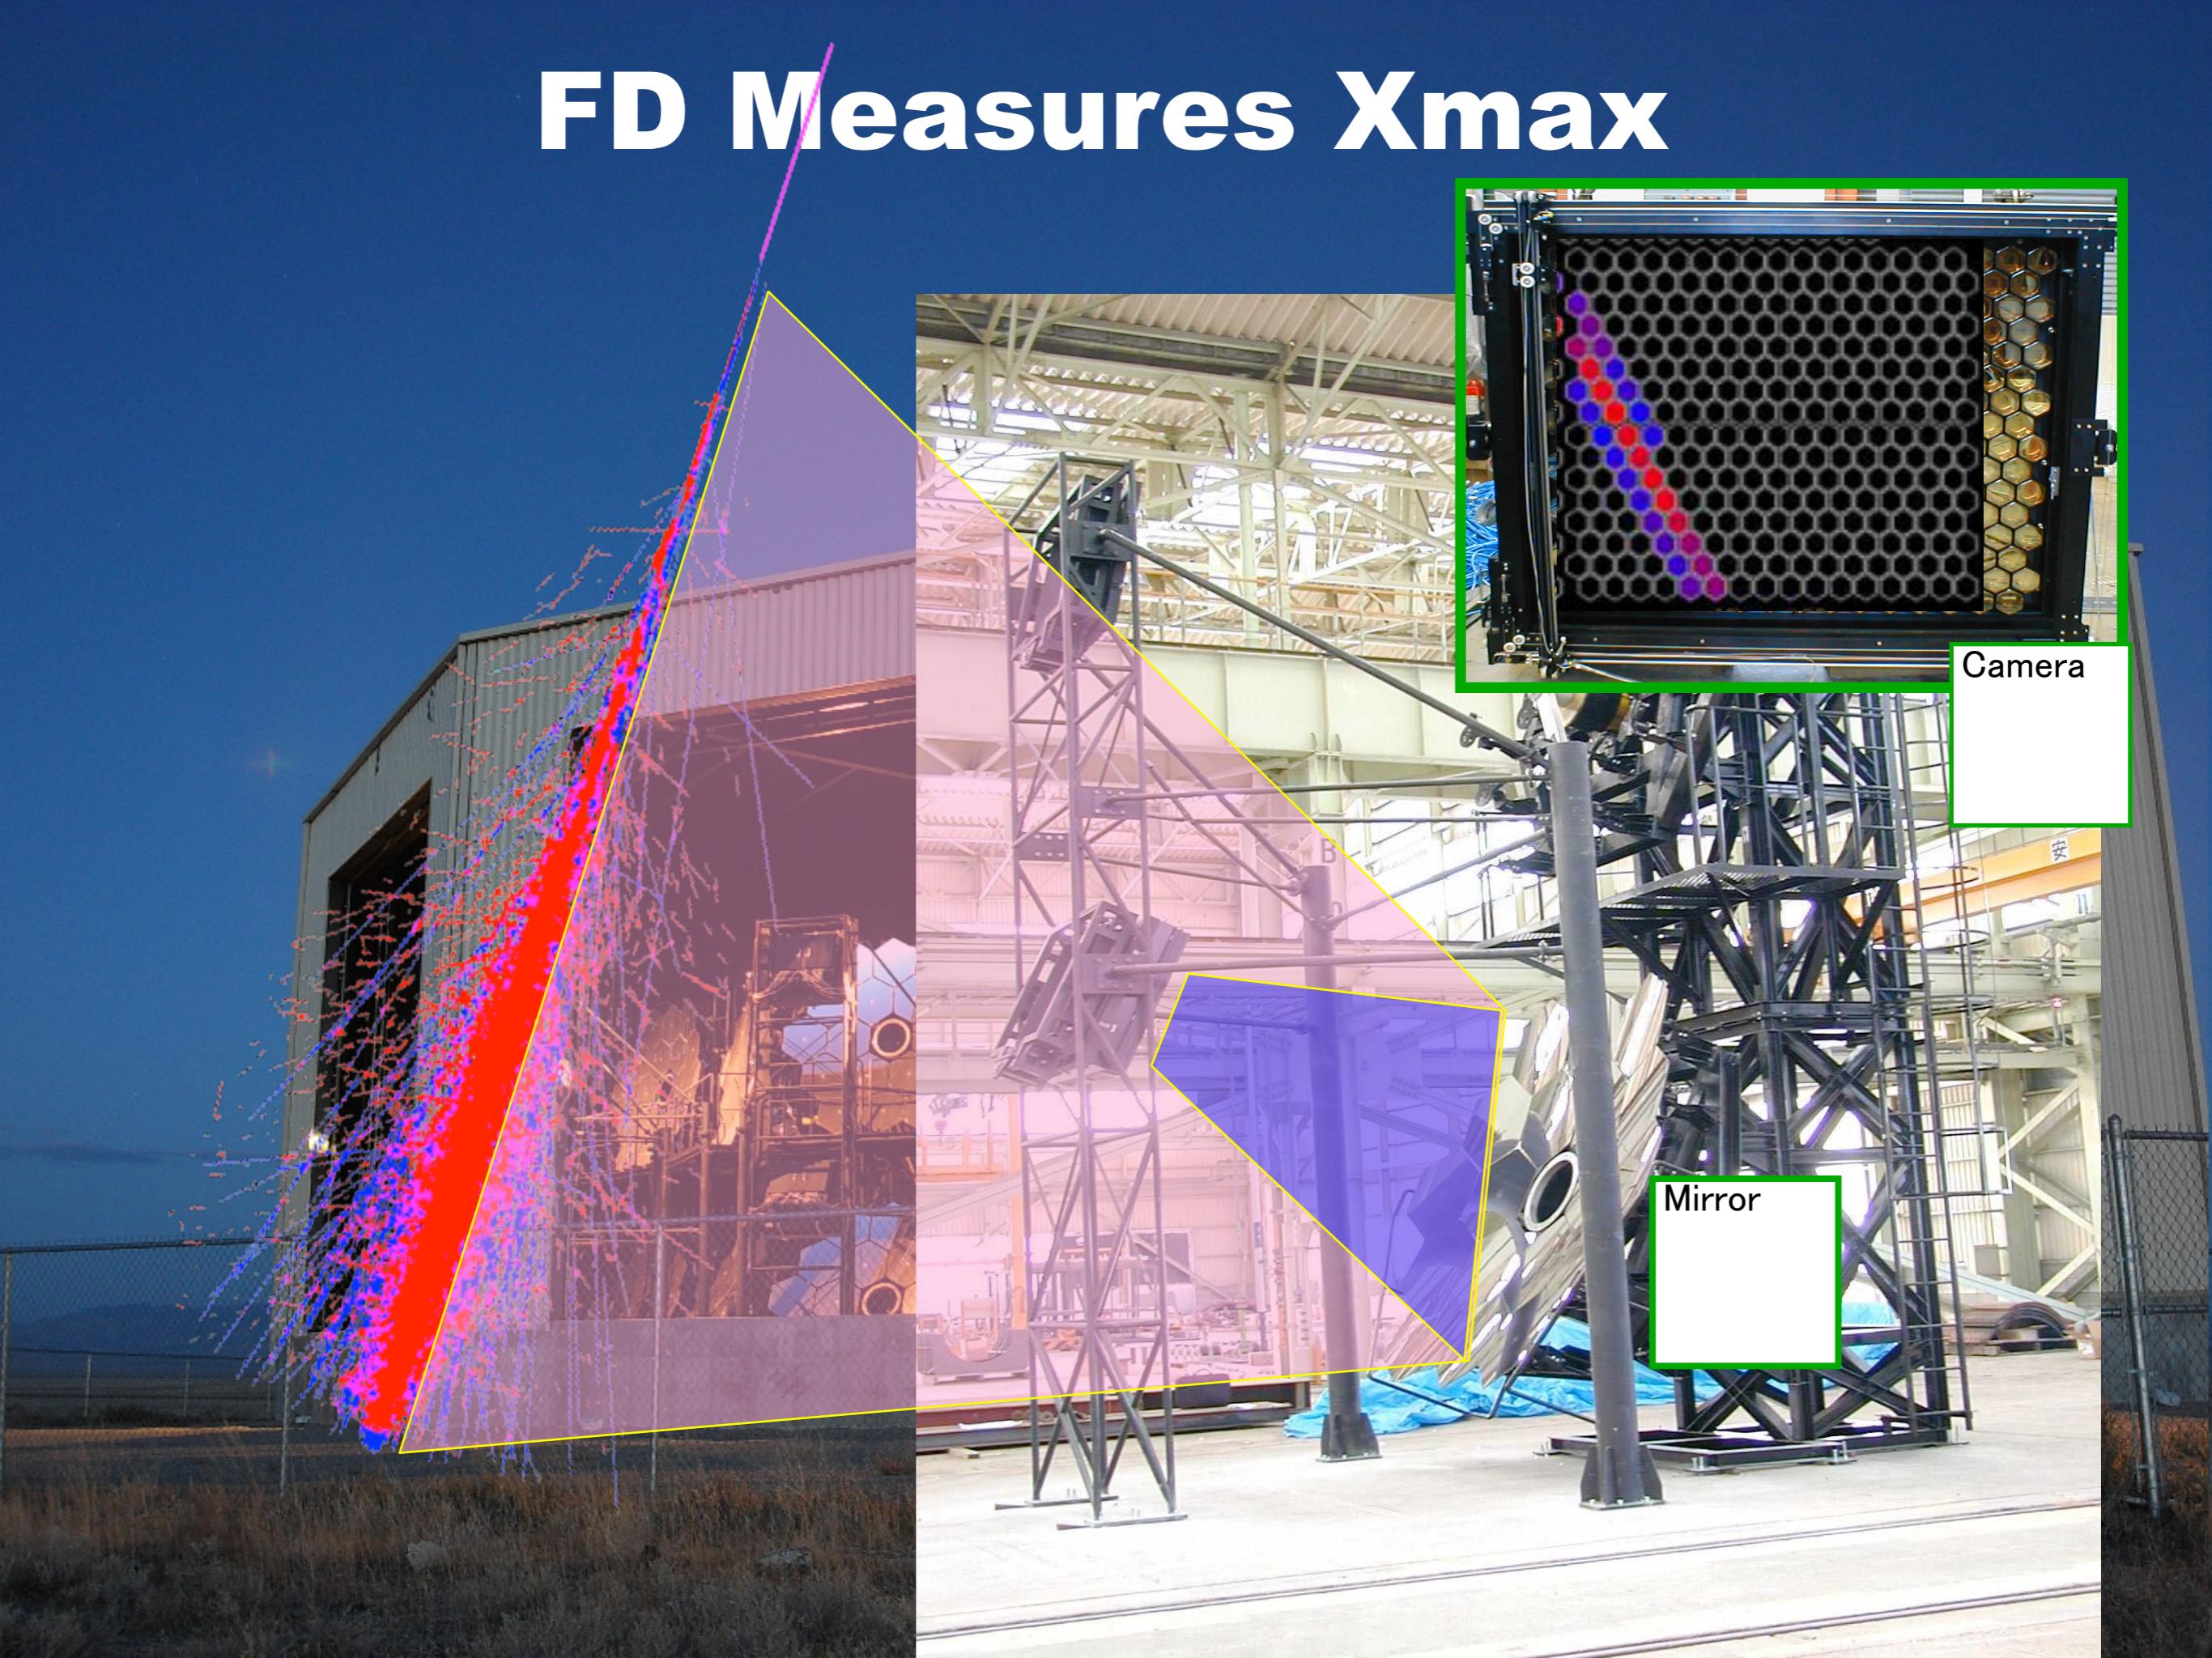

# FD Measures Xmax

# FD Measures Xmax

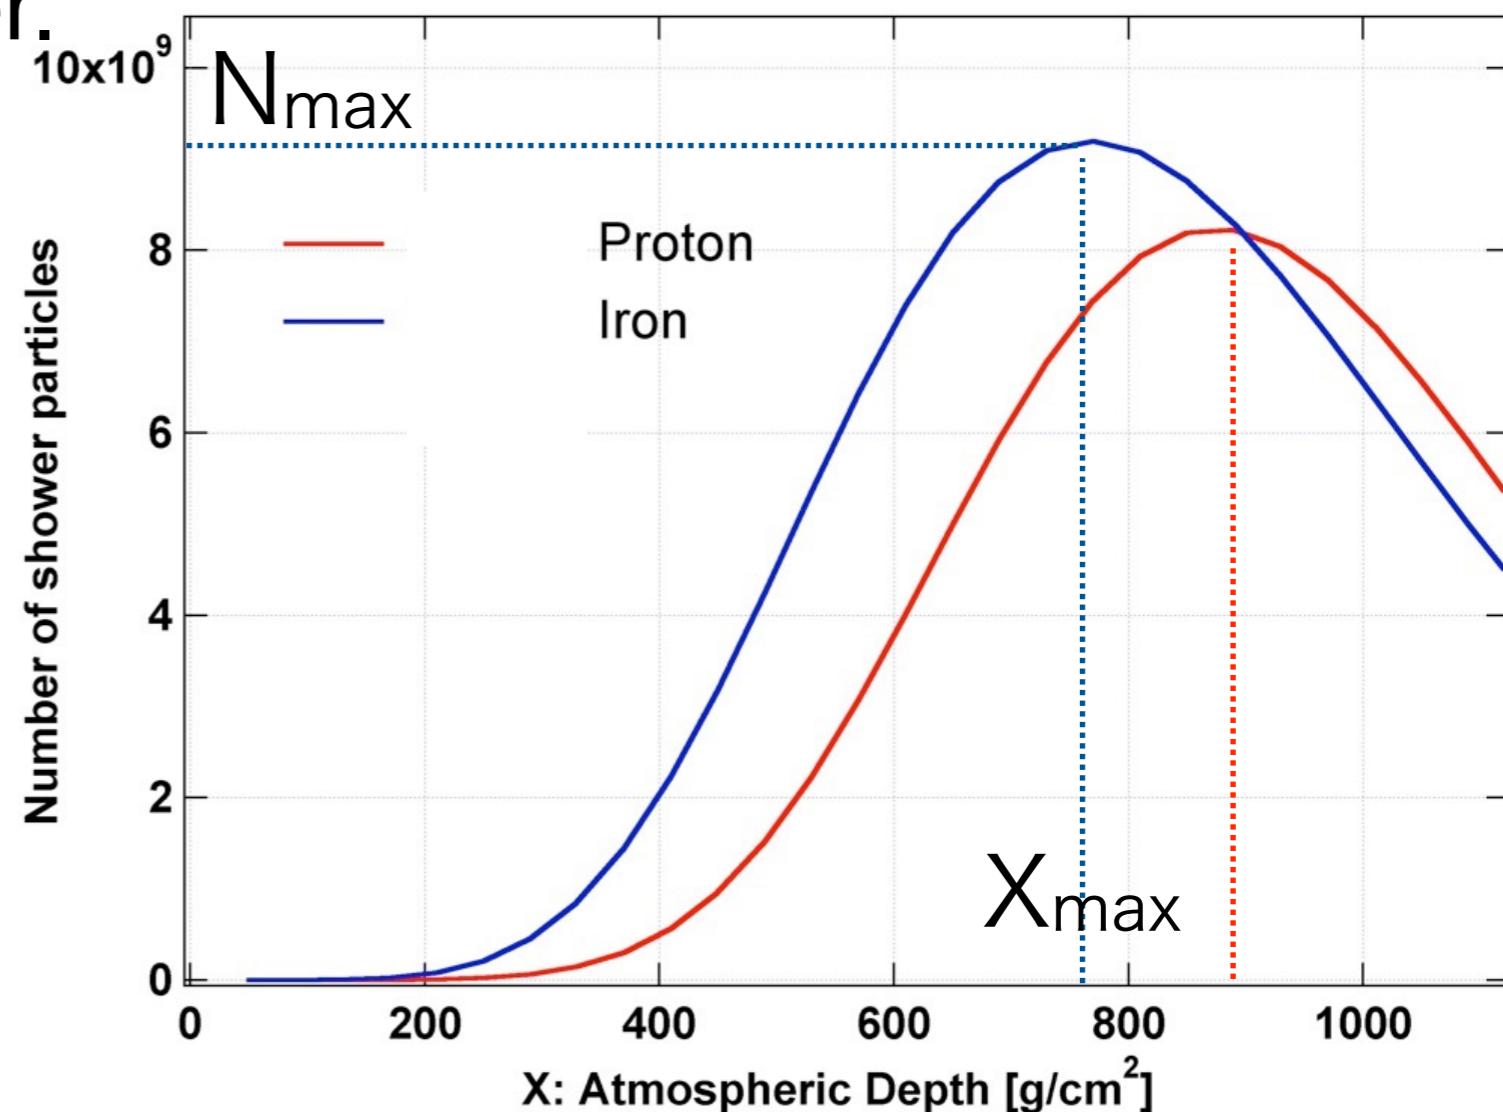

# FD Measures Xmax

# $X_{\max}$

- Depth at the shower maximum
- Heavier nuclei:
  - Larger cross section
  - Smaller energy/nucleon
- A shower by heavier nuclei develops rapidly and therefore  $X_{\max}$  gets smaller.
- Event-by-event fluctuation of  $X_{\max}$  is also smaller:
  - Heavier nucleus shower is a “superposition” of proton showers - its  $X_{\max}$  is an average of proton  $X_{\max}$ s.

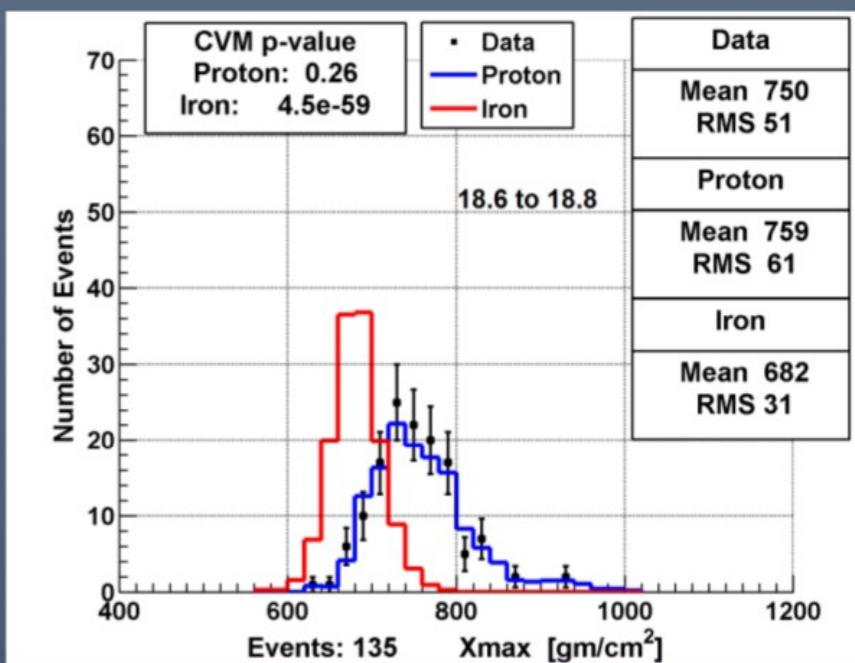

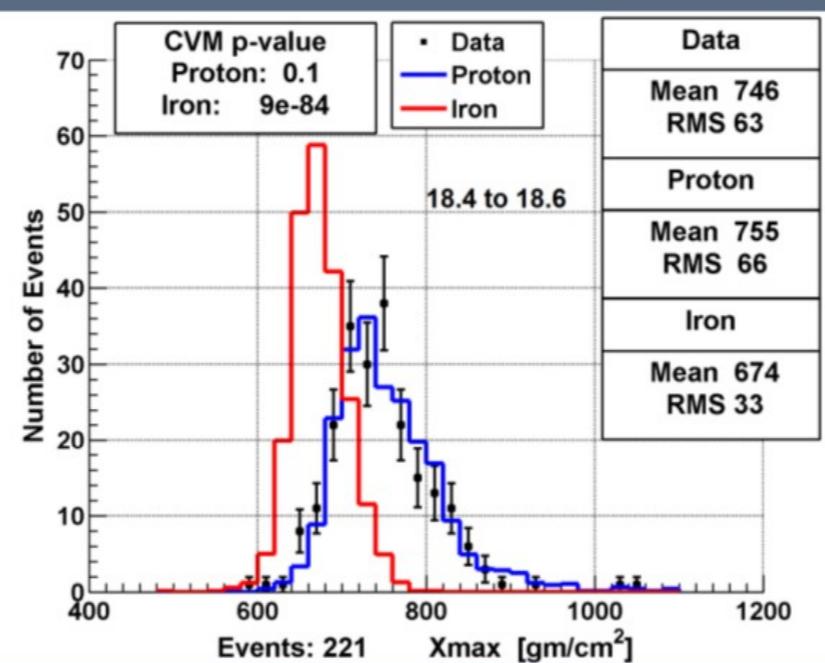

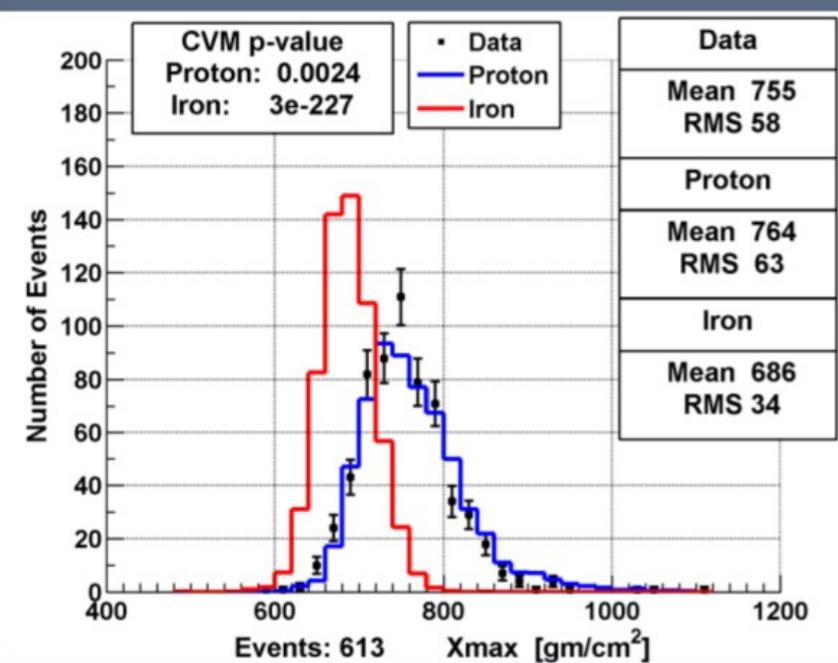

# MD <Xmax>

J.P. Lundquist ICRC2015

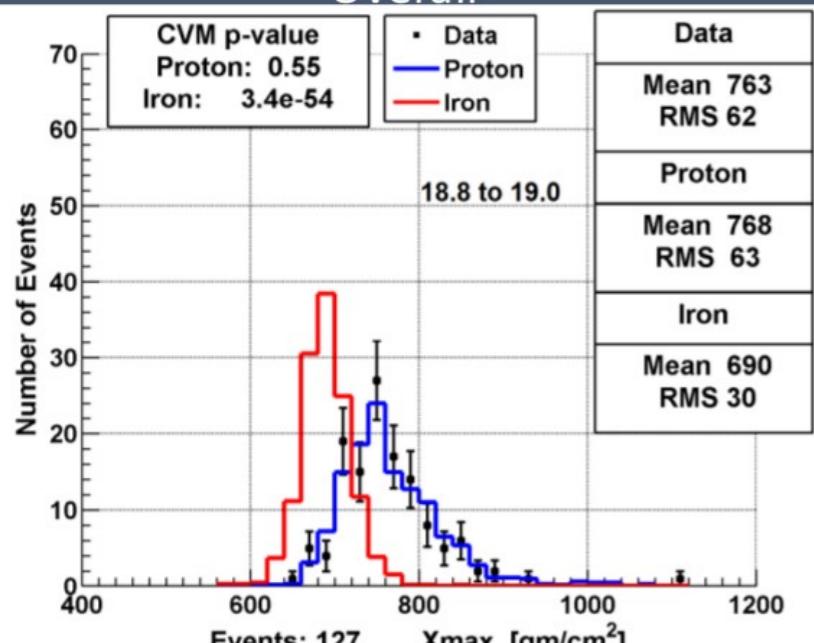

J. Belz ICRC2015

R. Abbasi *et al.*, *Astropart. Phys.*, **64**, 49 (2015)

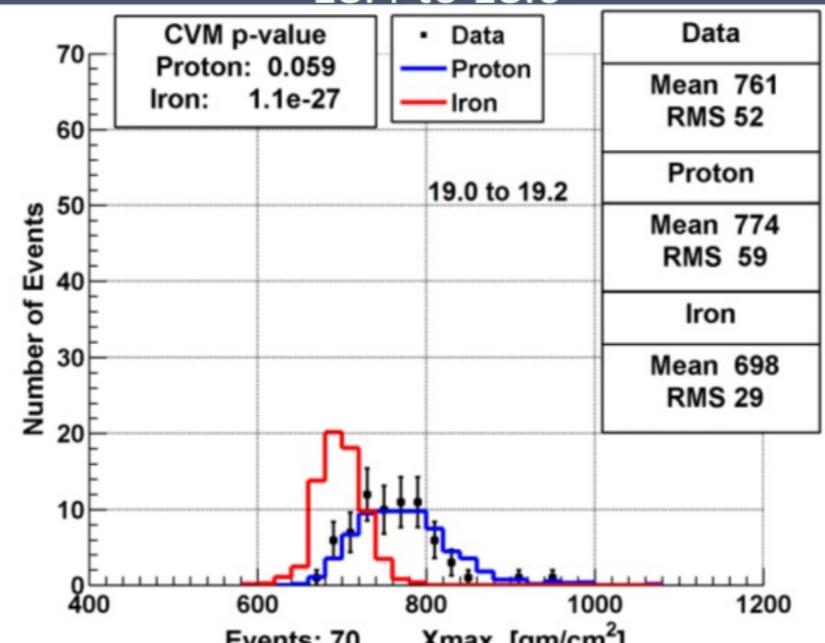

TA MD + SD. MC: QGSJET-II-03

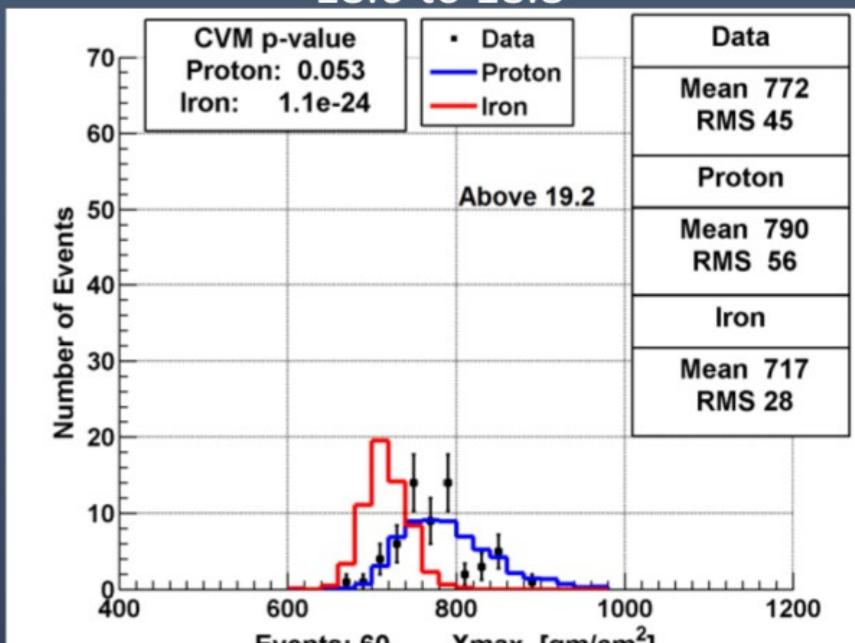

Overall

18.8 to 19.0

18.4 to 18.6

18.6 to 18.8

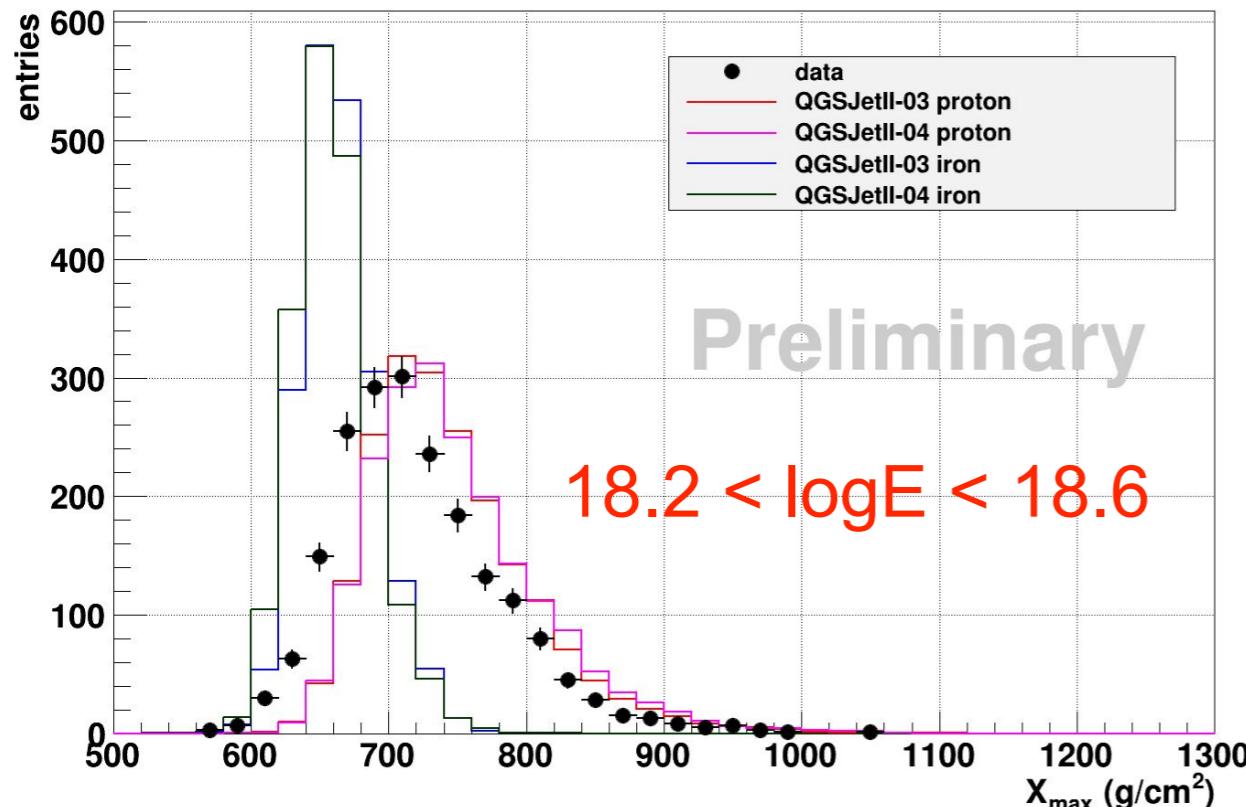

18.8 to 19

19 to 19.2

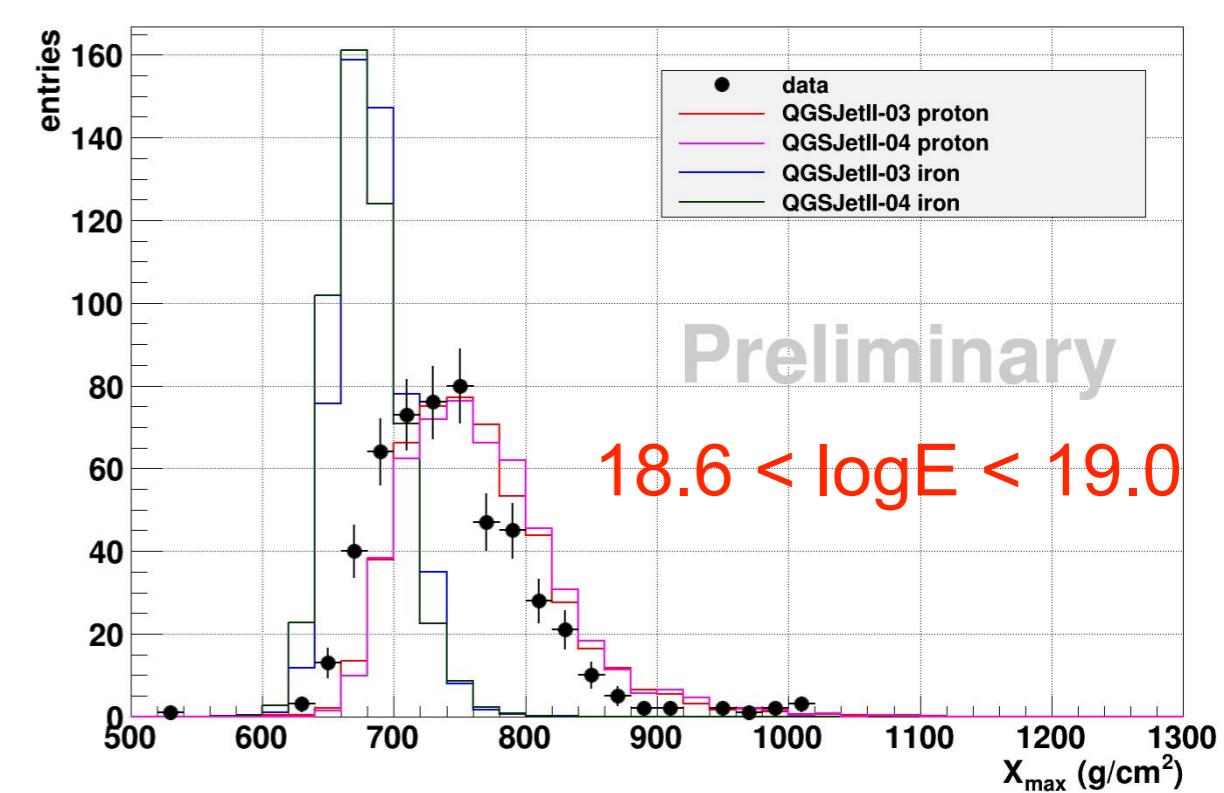

Greater than 19.2

# BR/LR X<sub>max</sub> Distributions

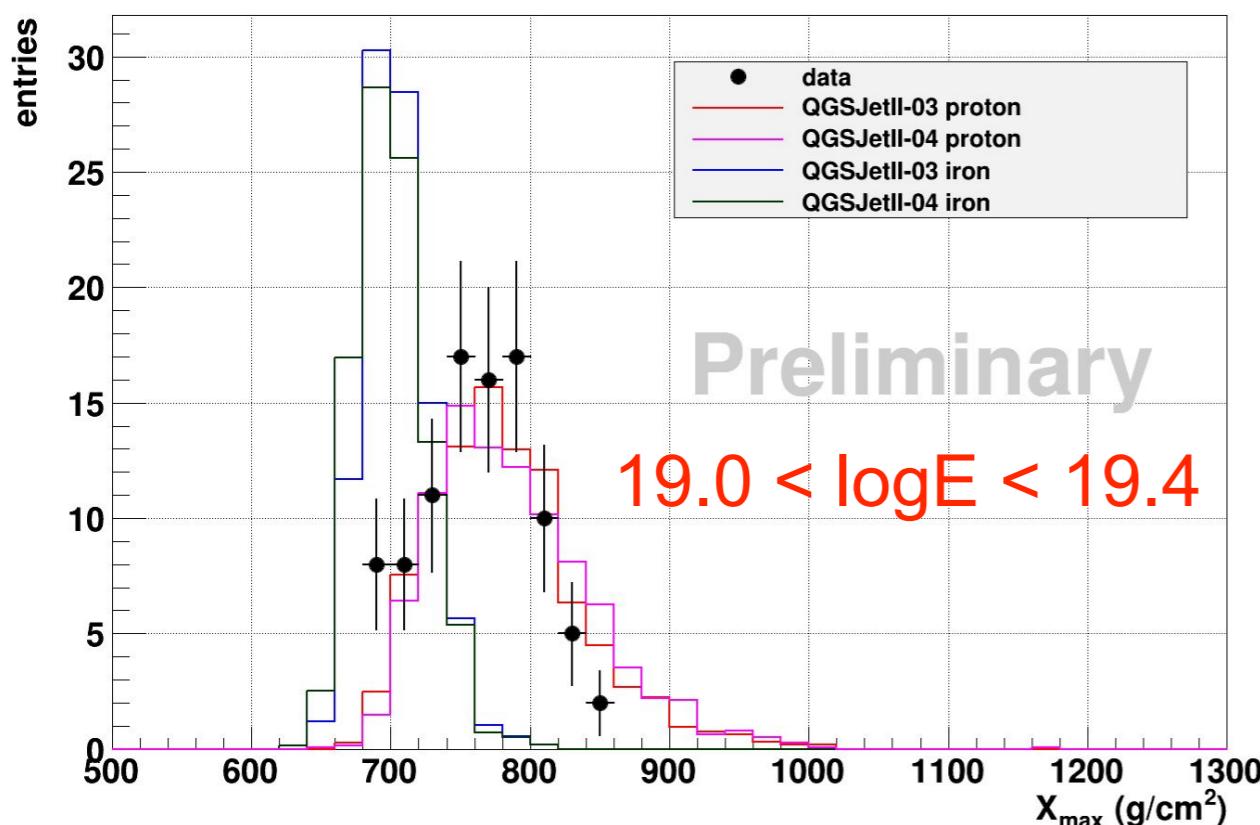

W. Hanlon, APS Meeting 2016

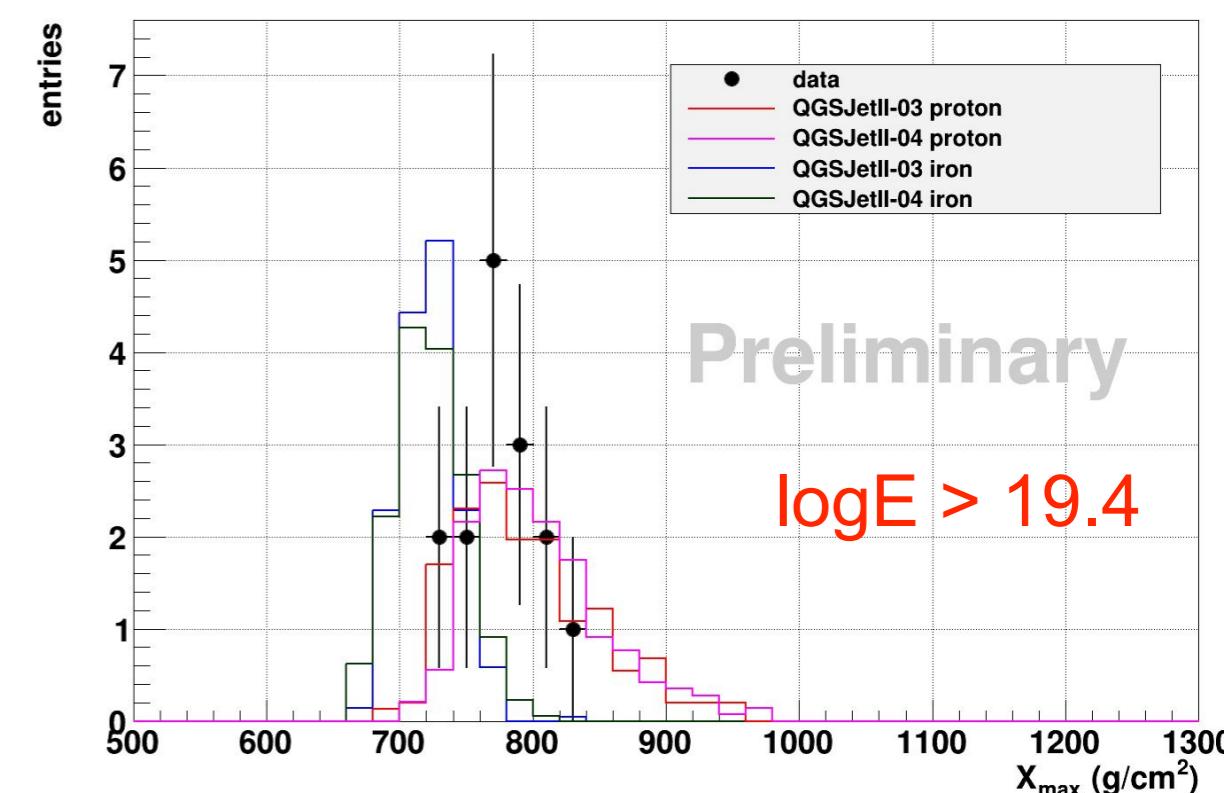

$18.2 < \log E < 18.6$

$18.6 < \log E < 19.0$

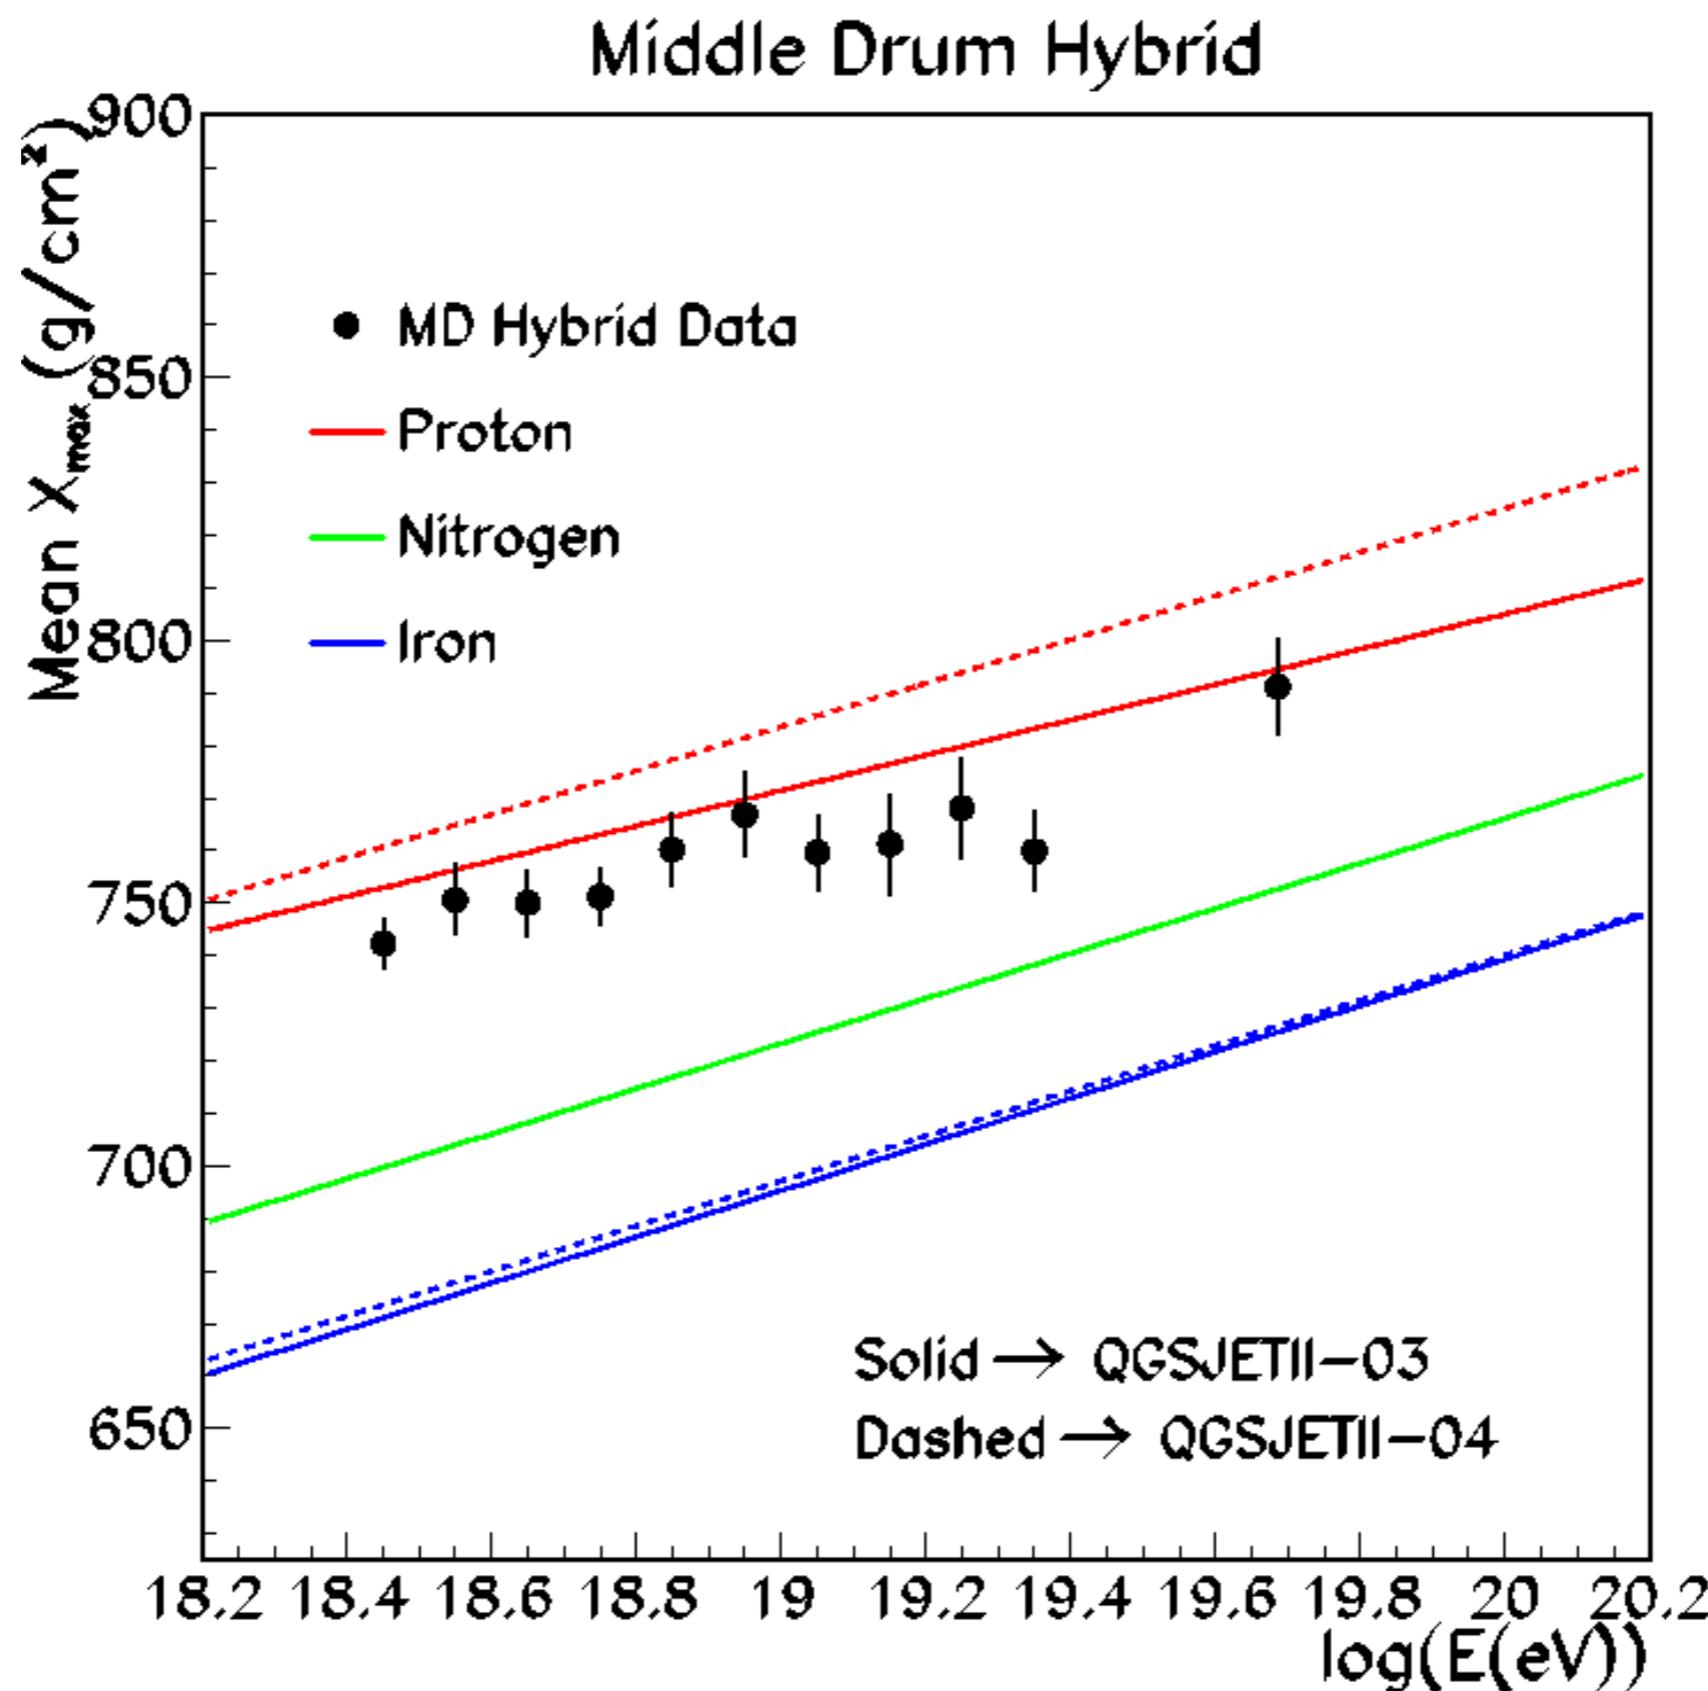

$19.0 < \log E < 19.4$

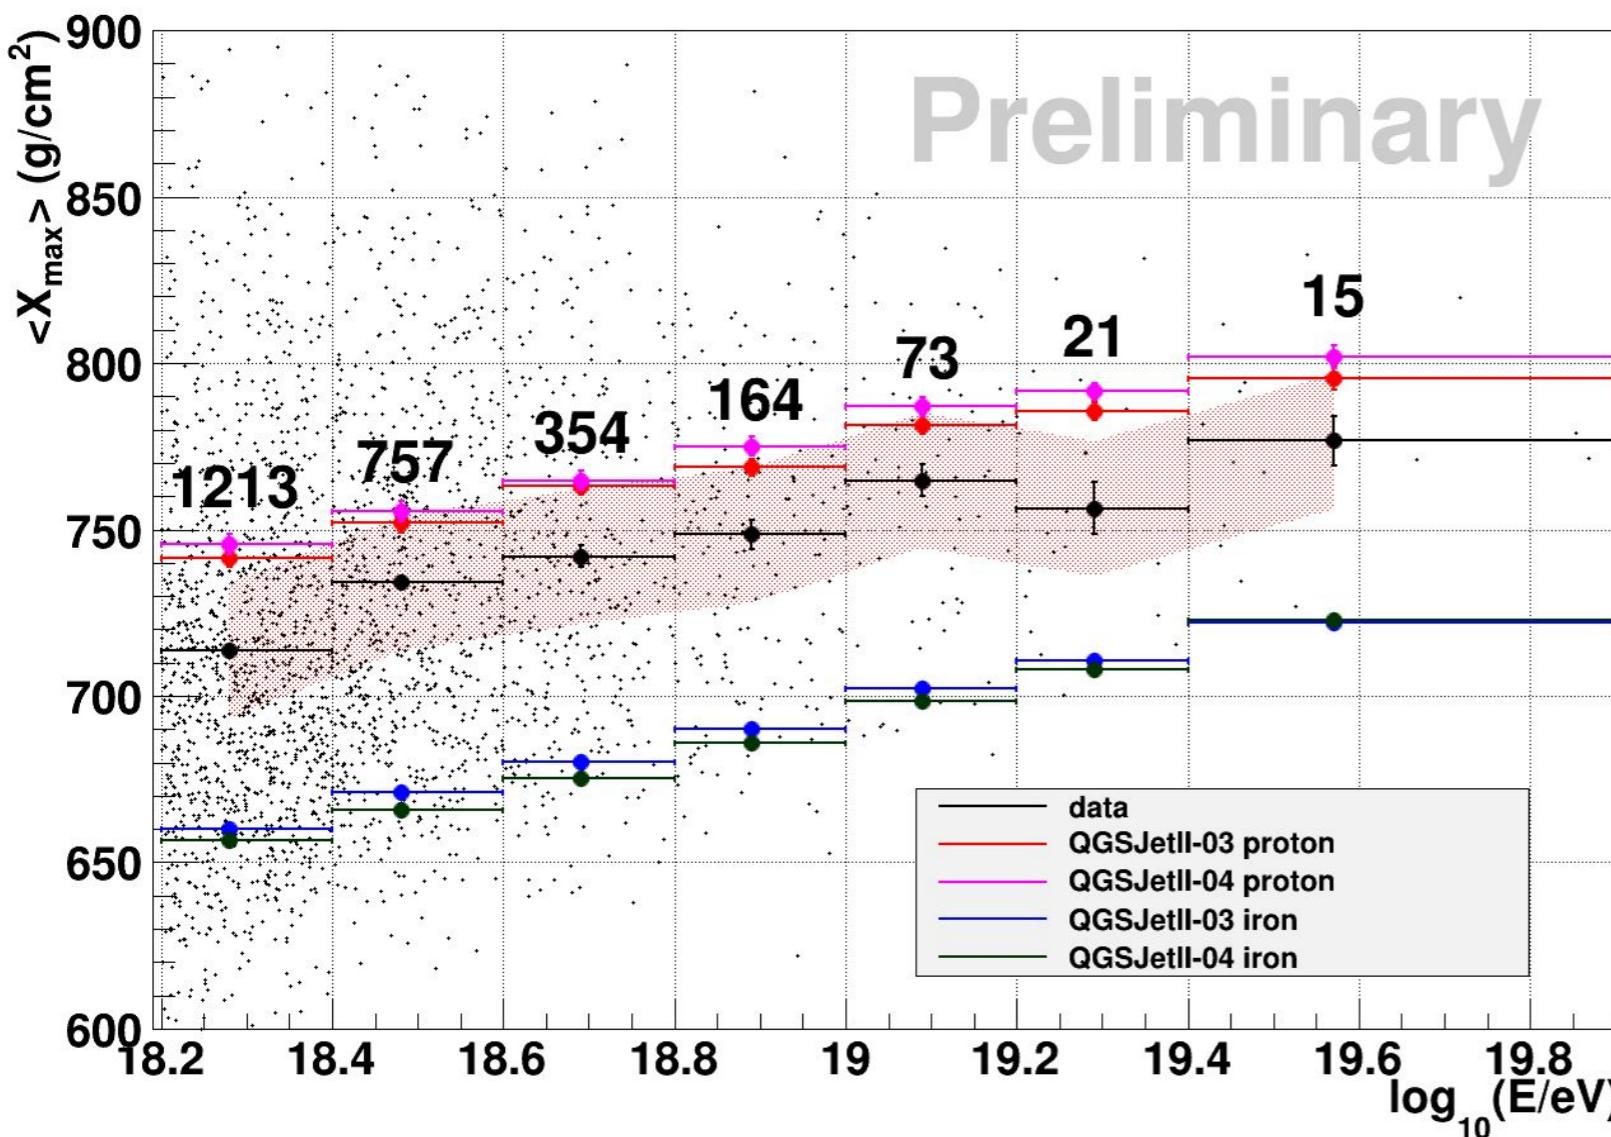

$\log E > 19.4$

# TA MD Elongation Rate

# BR/LR Elongation Rate

W. Hanlon, APS Meeting 2016

Mean  $X_{\max}$  with systematic uncertainties:

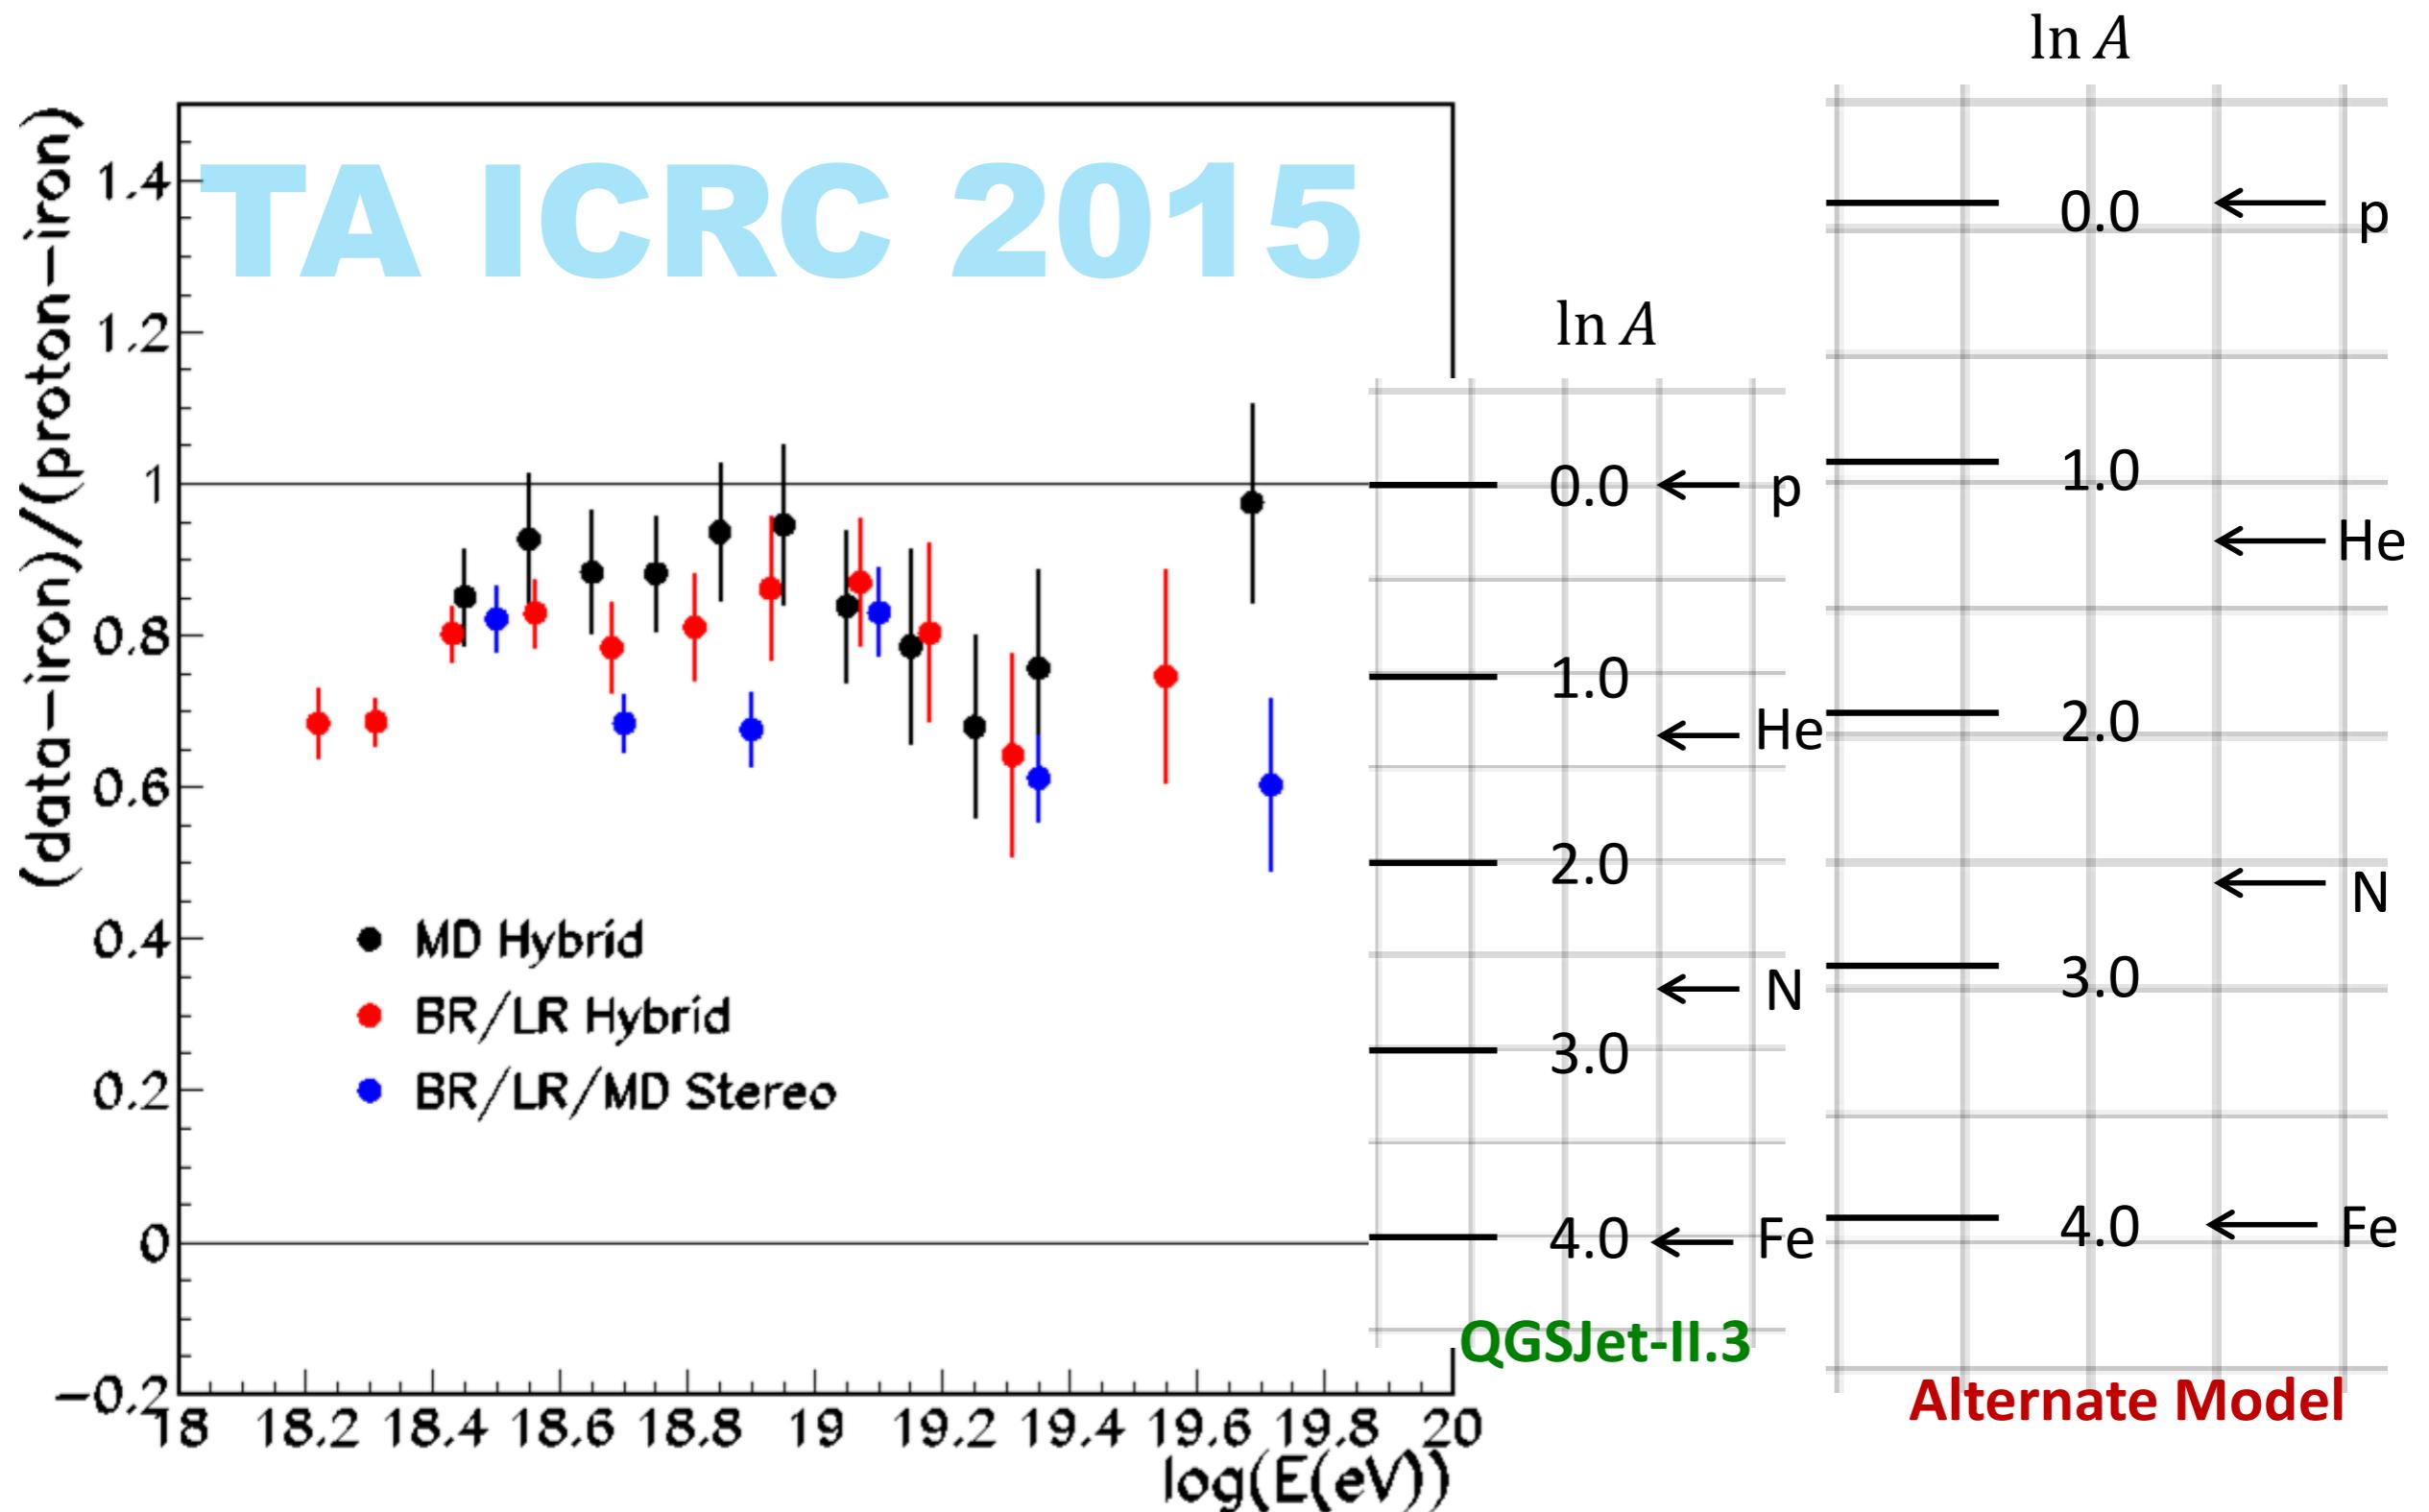

- 1) Reconstruction: 4.1 g/cm<sup>2</sup>
- 2) Atmospherics: 10.9 g/cm<sup>2</sup>
- 3) Detector geometry: 3.3 g/cm<sup>2</sup>
- 4) Aerosols: 2 g/cm<sup>2</sup>

Total systematic uncertainty: 20.3 g/cm<sup>2</sup>

Means favor a light composition.

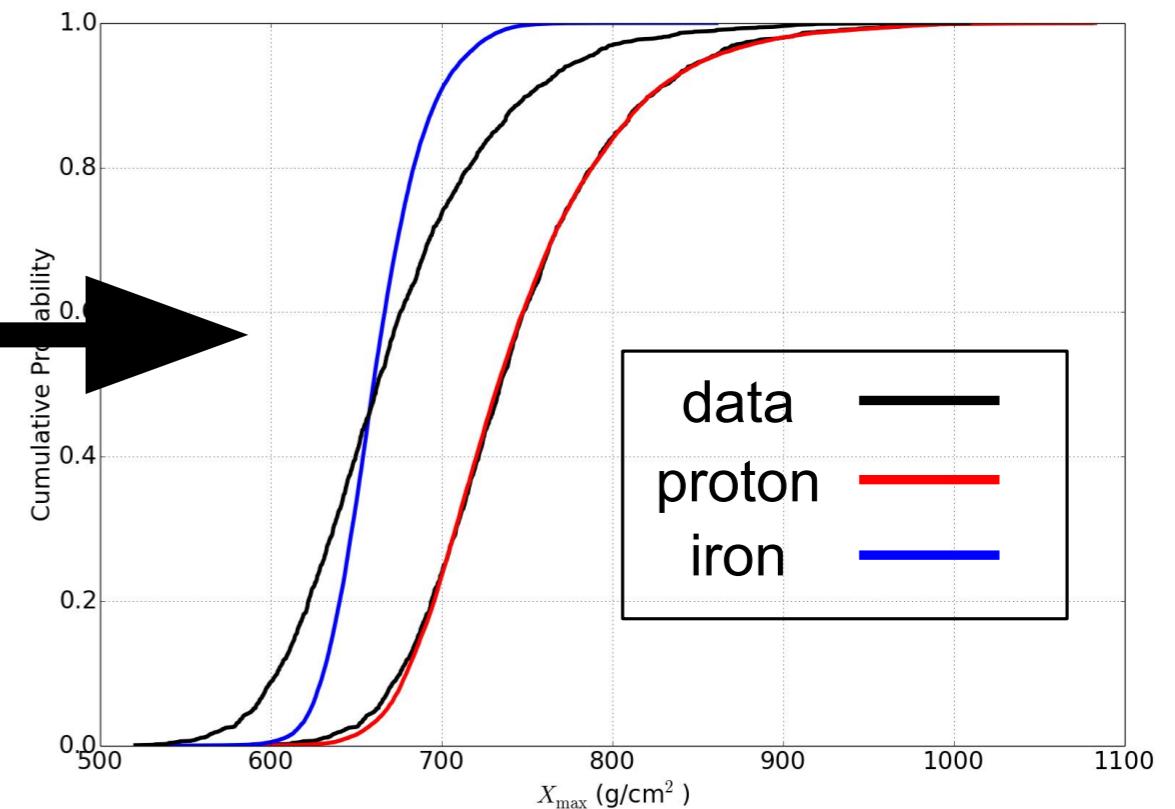

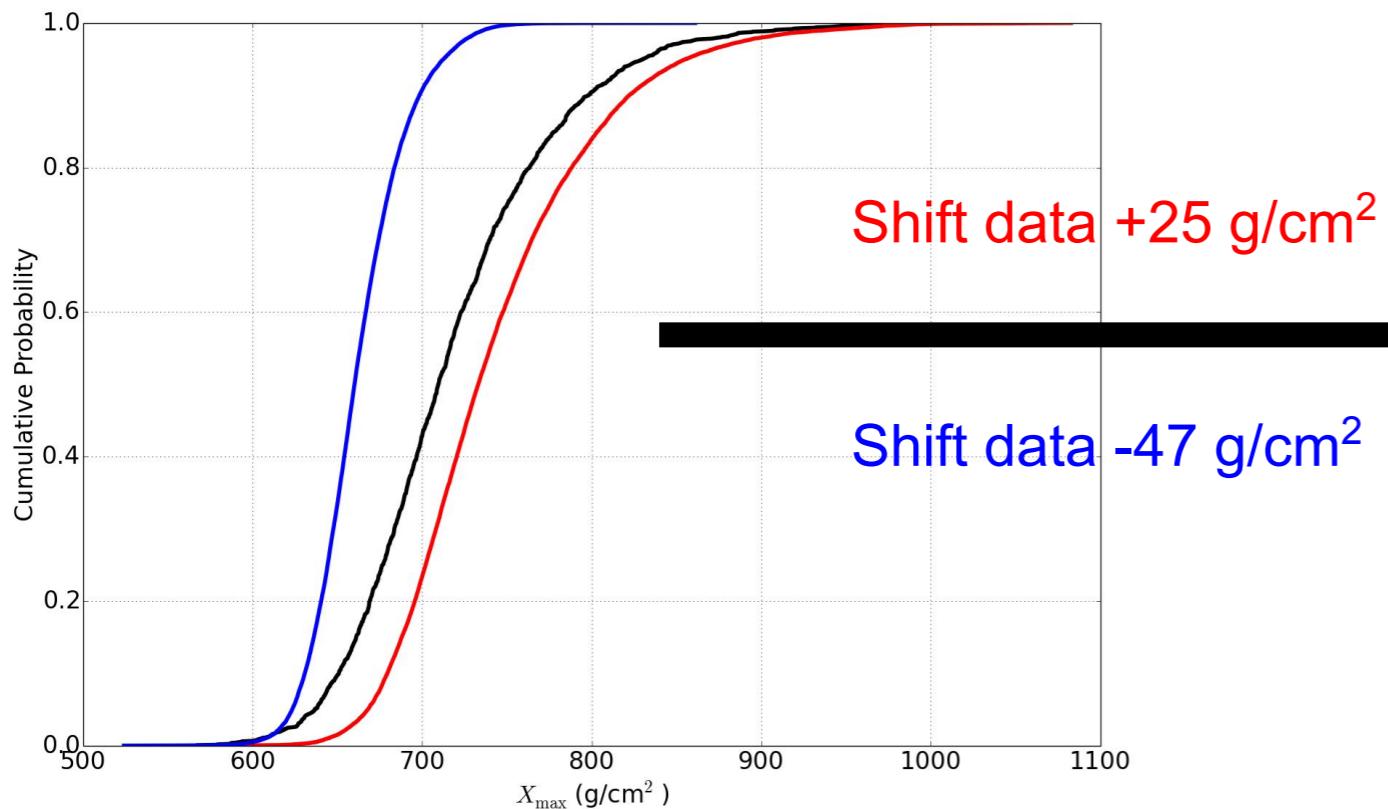

# $\langle \ln A \rangle$ Plot

Measures distance between the data and iron, normalize by (proton-iron), and scale in  $[\ln 1, \ln 56] = [0, 4]$ .

# Comparing Data and MC: CvM Test

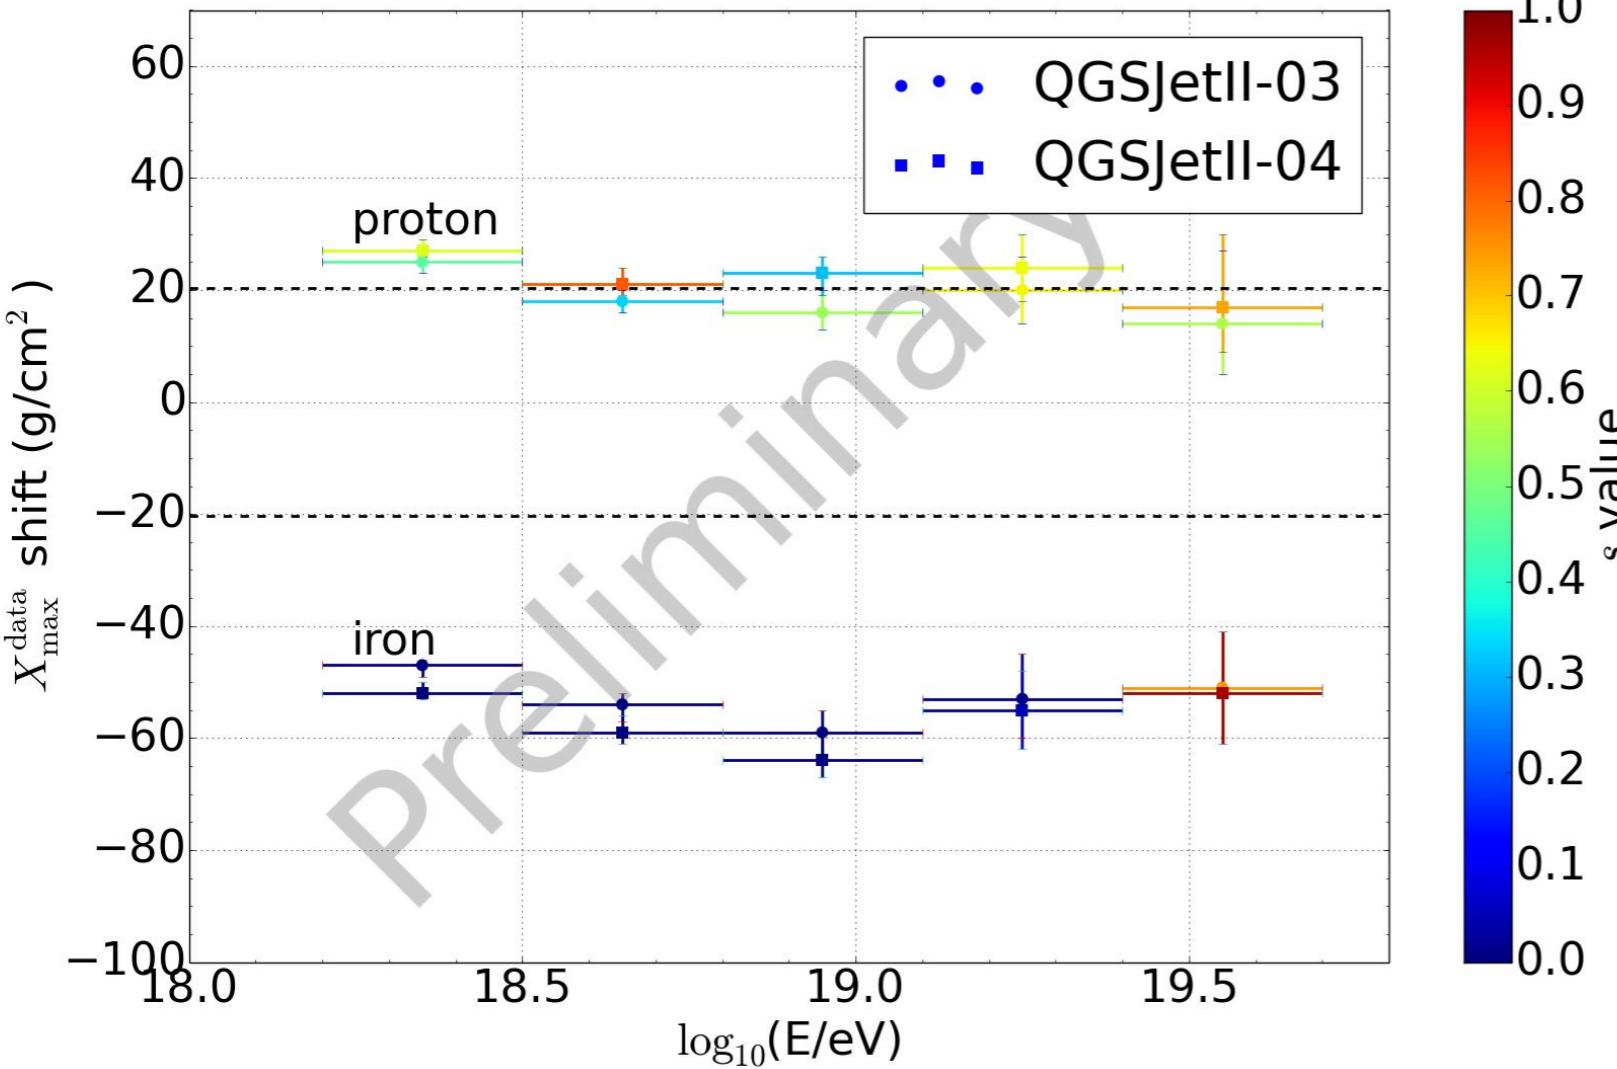

W. Hanlon, APS Meeting 2016

- Mean and RMS are heavily influenced by what happens in the tails → sampling bias.
- Utilize Cramér-von Mises (CvM) non-parametric goodness of fit test.
- Ask the question: how much does data need to be shifted to find agreement with CORSIKA models.
- Apply the CvM test to evaluate the agreement of the entire distribution without relying on the moments of the distribution.

# Comparing Data and MC: CvM Test

W. Hanlon, APS Meeting 2016

Amount that data needs to be shifted to match CORSIKA models. Find the best value of the two-sample CvM test statistic.

$s$ -value is the  $p$ -value under the assumption both samples were drawn from the same parent distribution *after shifting the data*.

To find agreement with heavy elements, large shifts are needed and the  $s$ -values are too small.

Light composition is favored.

$X_{\max}^{\text{data}}$  systematics:  $\pm 20.3 \text{ g}/\text{cm}^2$

# Cross Section of CR-Air interaction

# p-Air Cross Section from Xmax Distribution

- Interaction length of CR proton in the air

$$\lambda_{p\text{-Air}} = \frac{1}{Am_p\sigma_{p\text{-Air}}}$$

- Depth of first int. distributes in exp. with the slope  $\lambda_{p\text{-Air}}$

- Exp. slope of Xmax

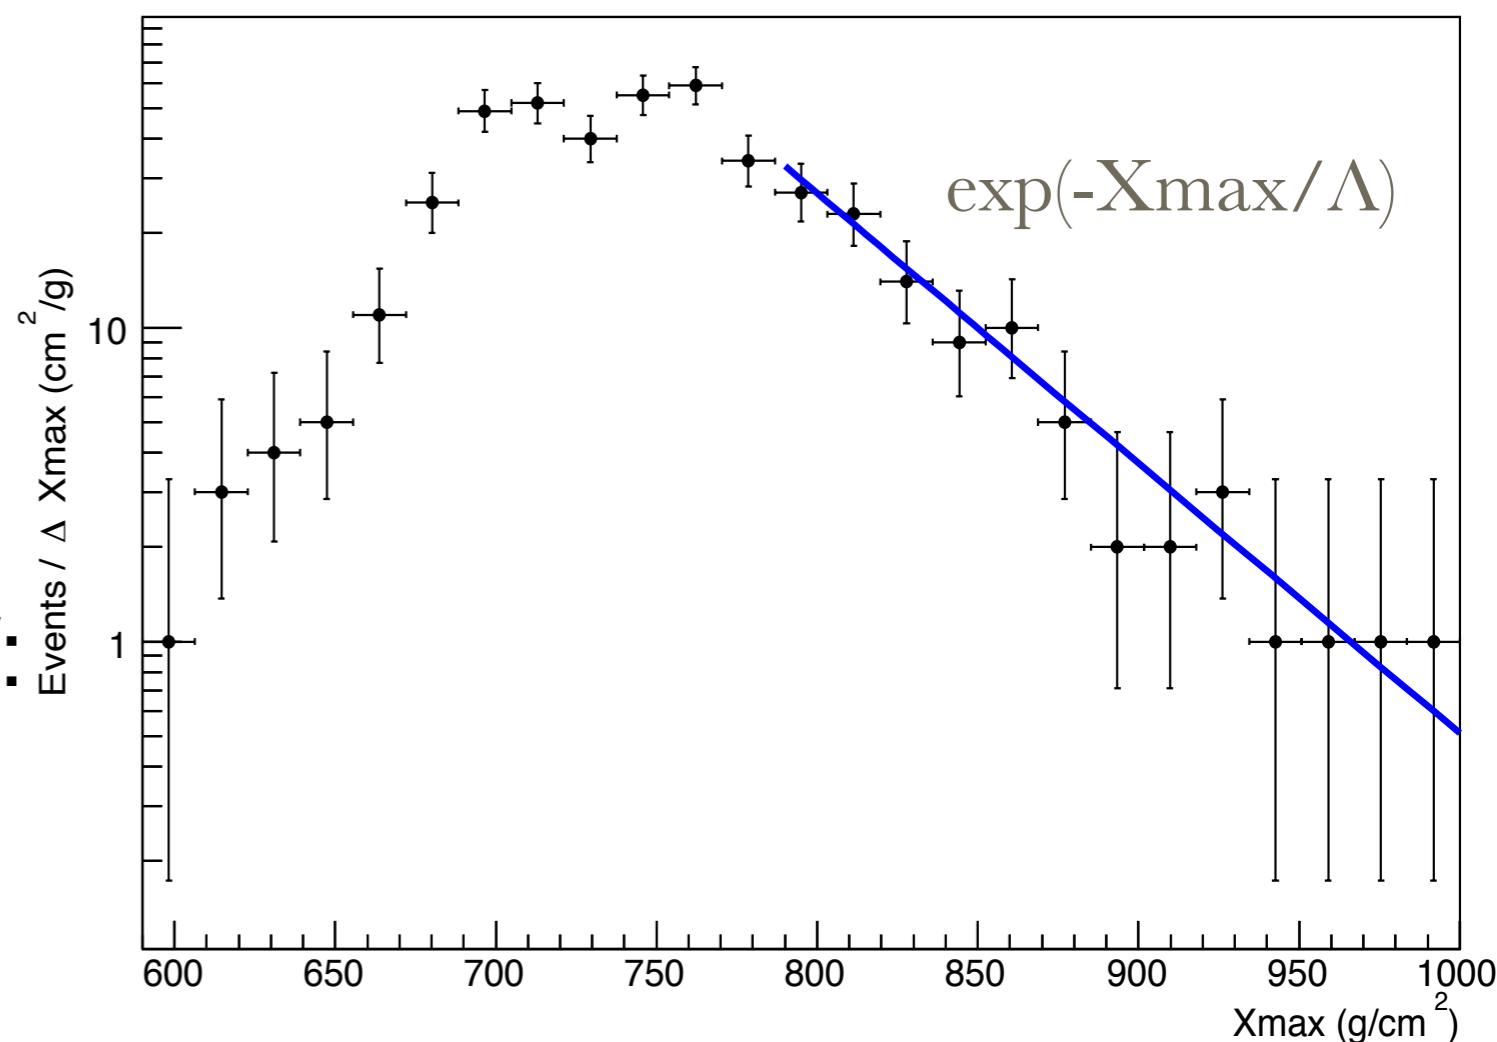

$$\Lambda_{p\text{-Air}} = k\lambda_{p\text{-Air}}$$

- TA MD data in  $10^{18.3\text{-}19.3}\text{eV}$ :

$$\Lambda_{p\text{-Air}} = 50.5 \pm 6.3 \text{ g/cm}^2$$

- Need  $k$  to obtain  $\lambda$

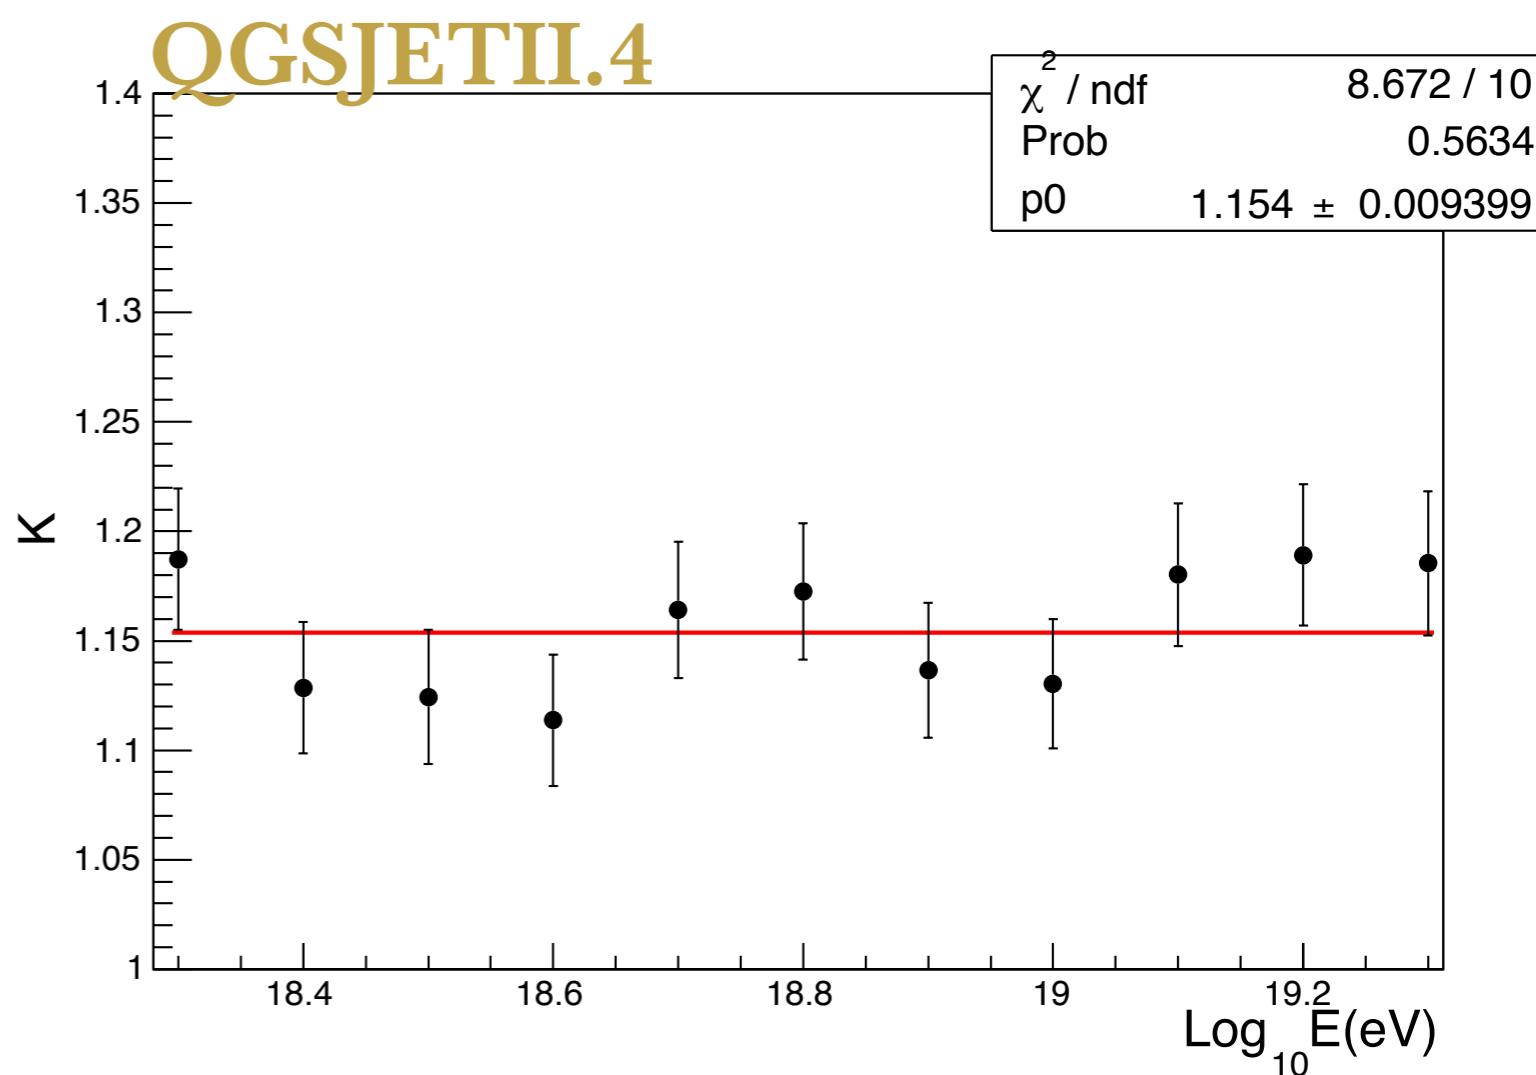

R. Abbasi ICRC2015,  
R. Abbasi et al., Phys. Rev. D, 92, 032007 (2015)

# Estimating k values

- $10^4$  showers in each  $d\log E = 0.1$  step
- Calculate  $k$  from the slopes  $\Lambda$  of  $X_{\max}$  and  $\lambda$  of  $X_1$
- Acceptance bias negligible:  $k$  of MC-thrown showers and reconstructed showers are the same.

Model	$k$ (Error = 0.01)
QGSJET-II-04	1.15
QGSJET-01	1.22
SIBYLL	1.18
EPOS-LHC	1.19

# p-Air Cross Section

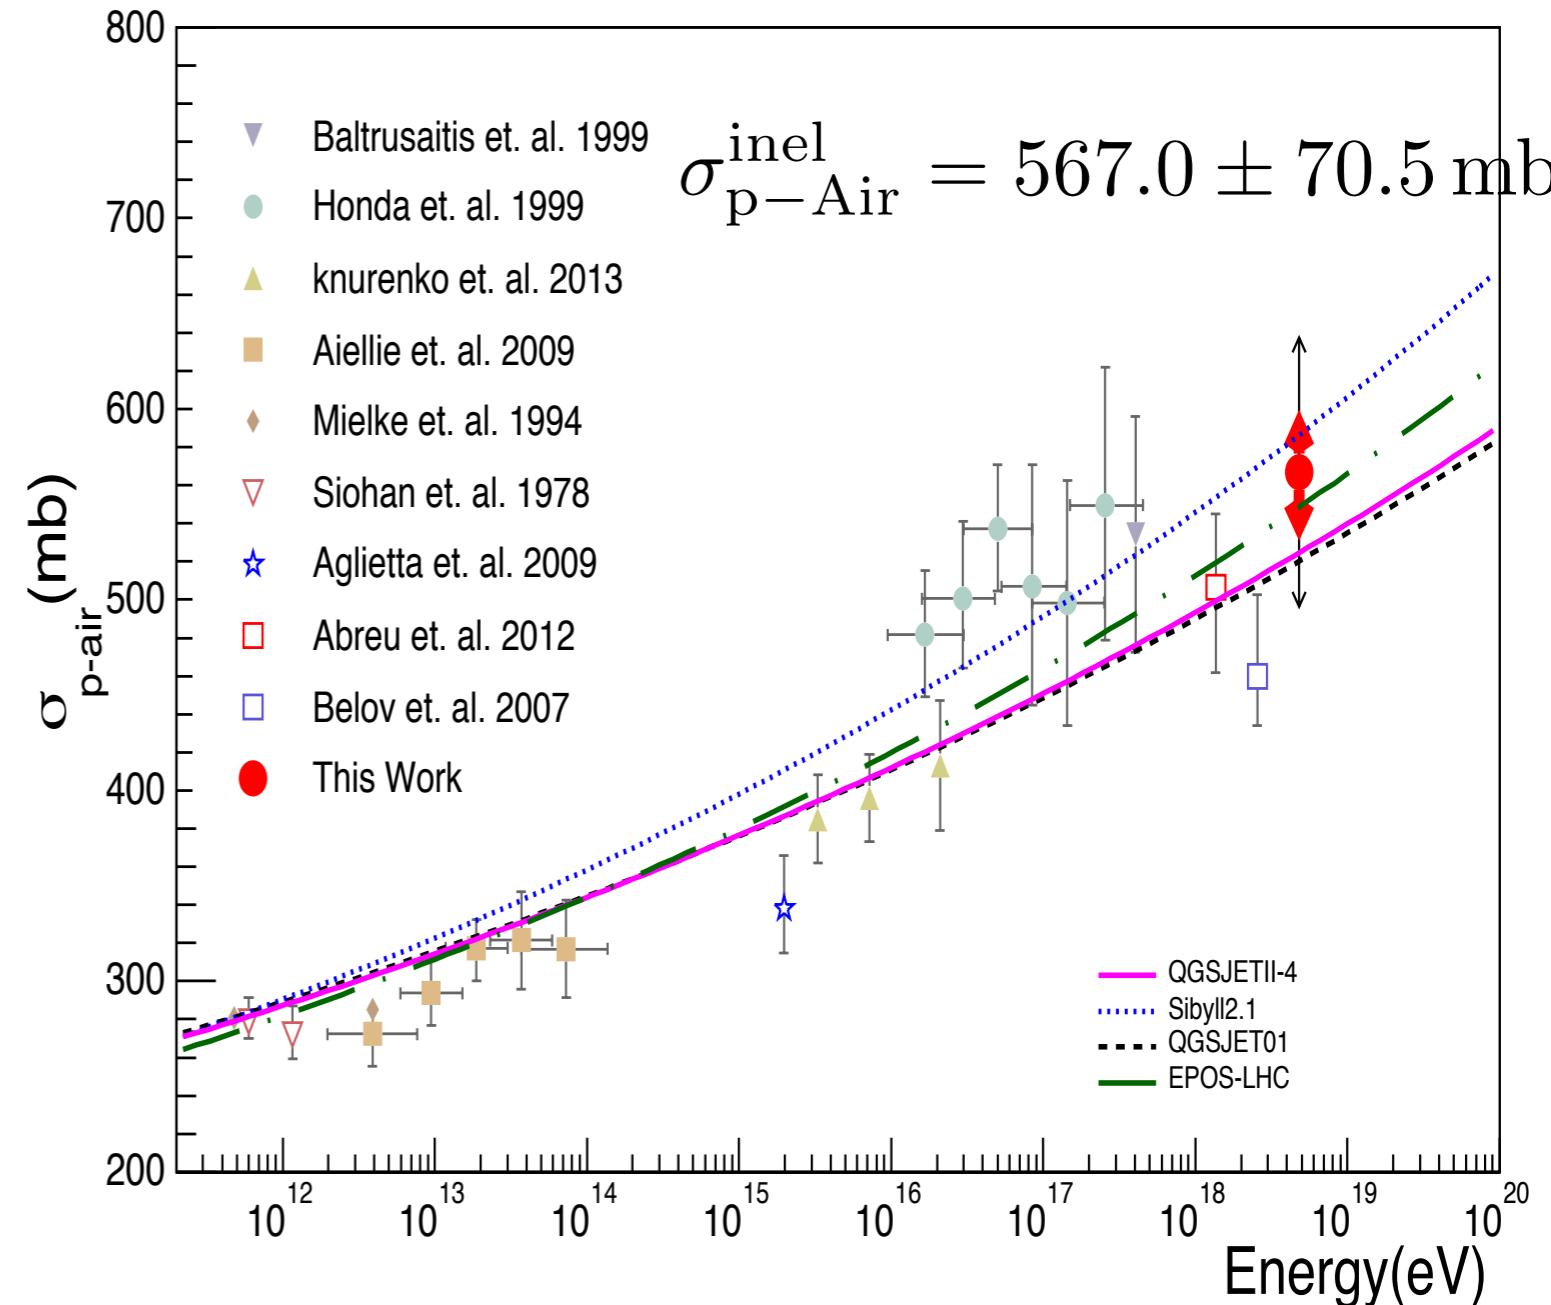

Model	$k = \Lambda/\lambda$ (Error = 0.01)	$\sigma_{\text{p-Air}} [\text{mb}]$
<b>QGSJET-II-04</b>	1.15	$550.3 \pm 68.5$
<b>QGSJET-01</b>	1.22	$583.7 \pm 72.6$
<b>SIBYLL</b>	1.18	$564.6 \pm 70.2$
<b>EPOS-LHC</b>	1.19	$569.4 \pm 70.8$

$$\sigma_{\text{p-Air}}^{\text{inel}} = 567.0 \pm 70.5 \text{ mb} \quad \sqrt{s} \sim 95 \text{ TeV}$$

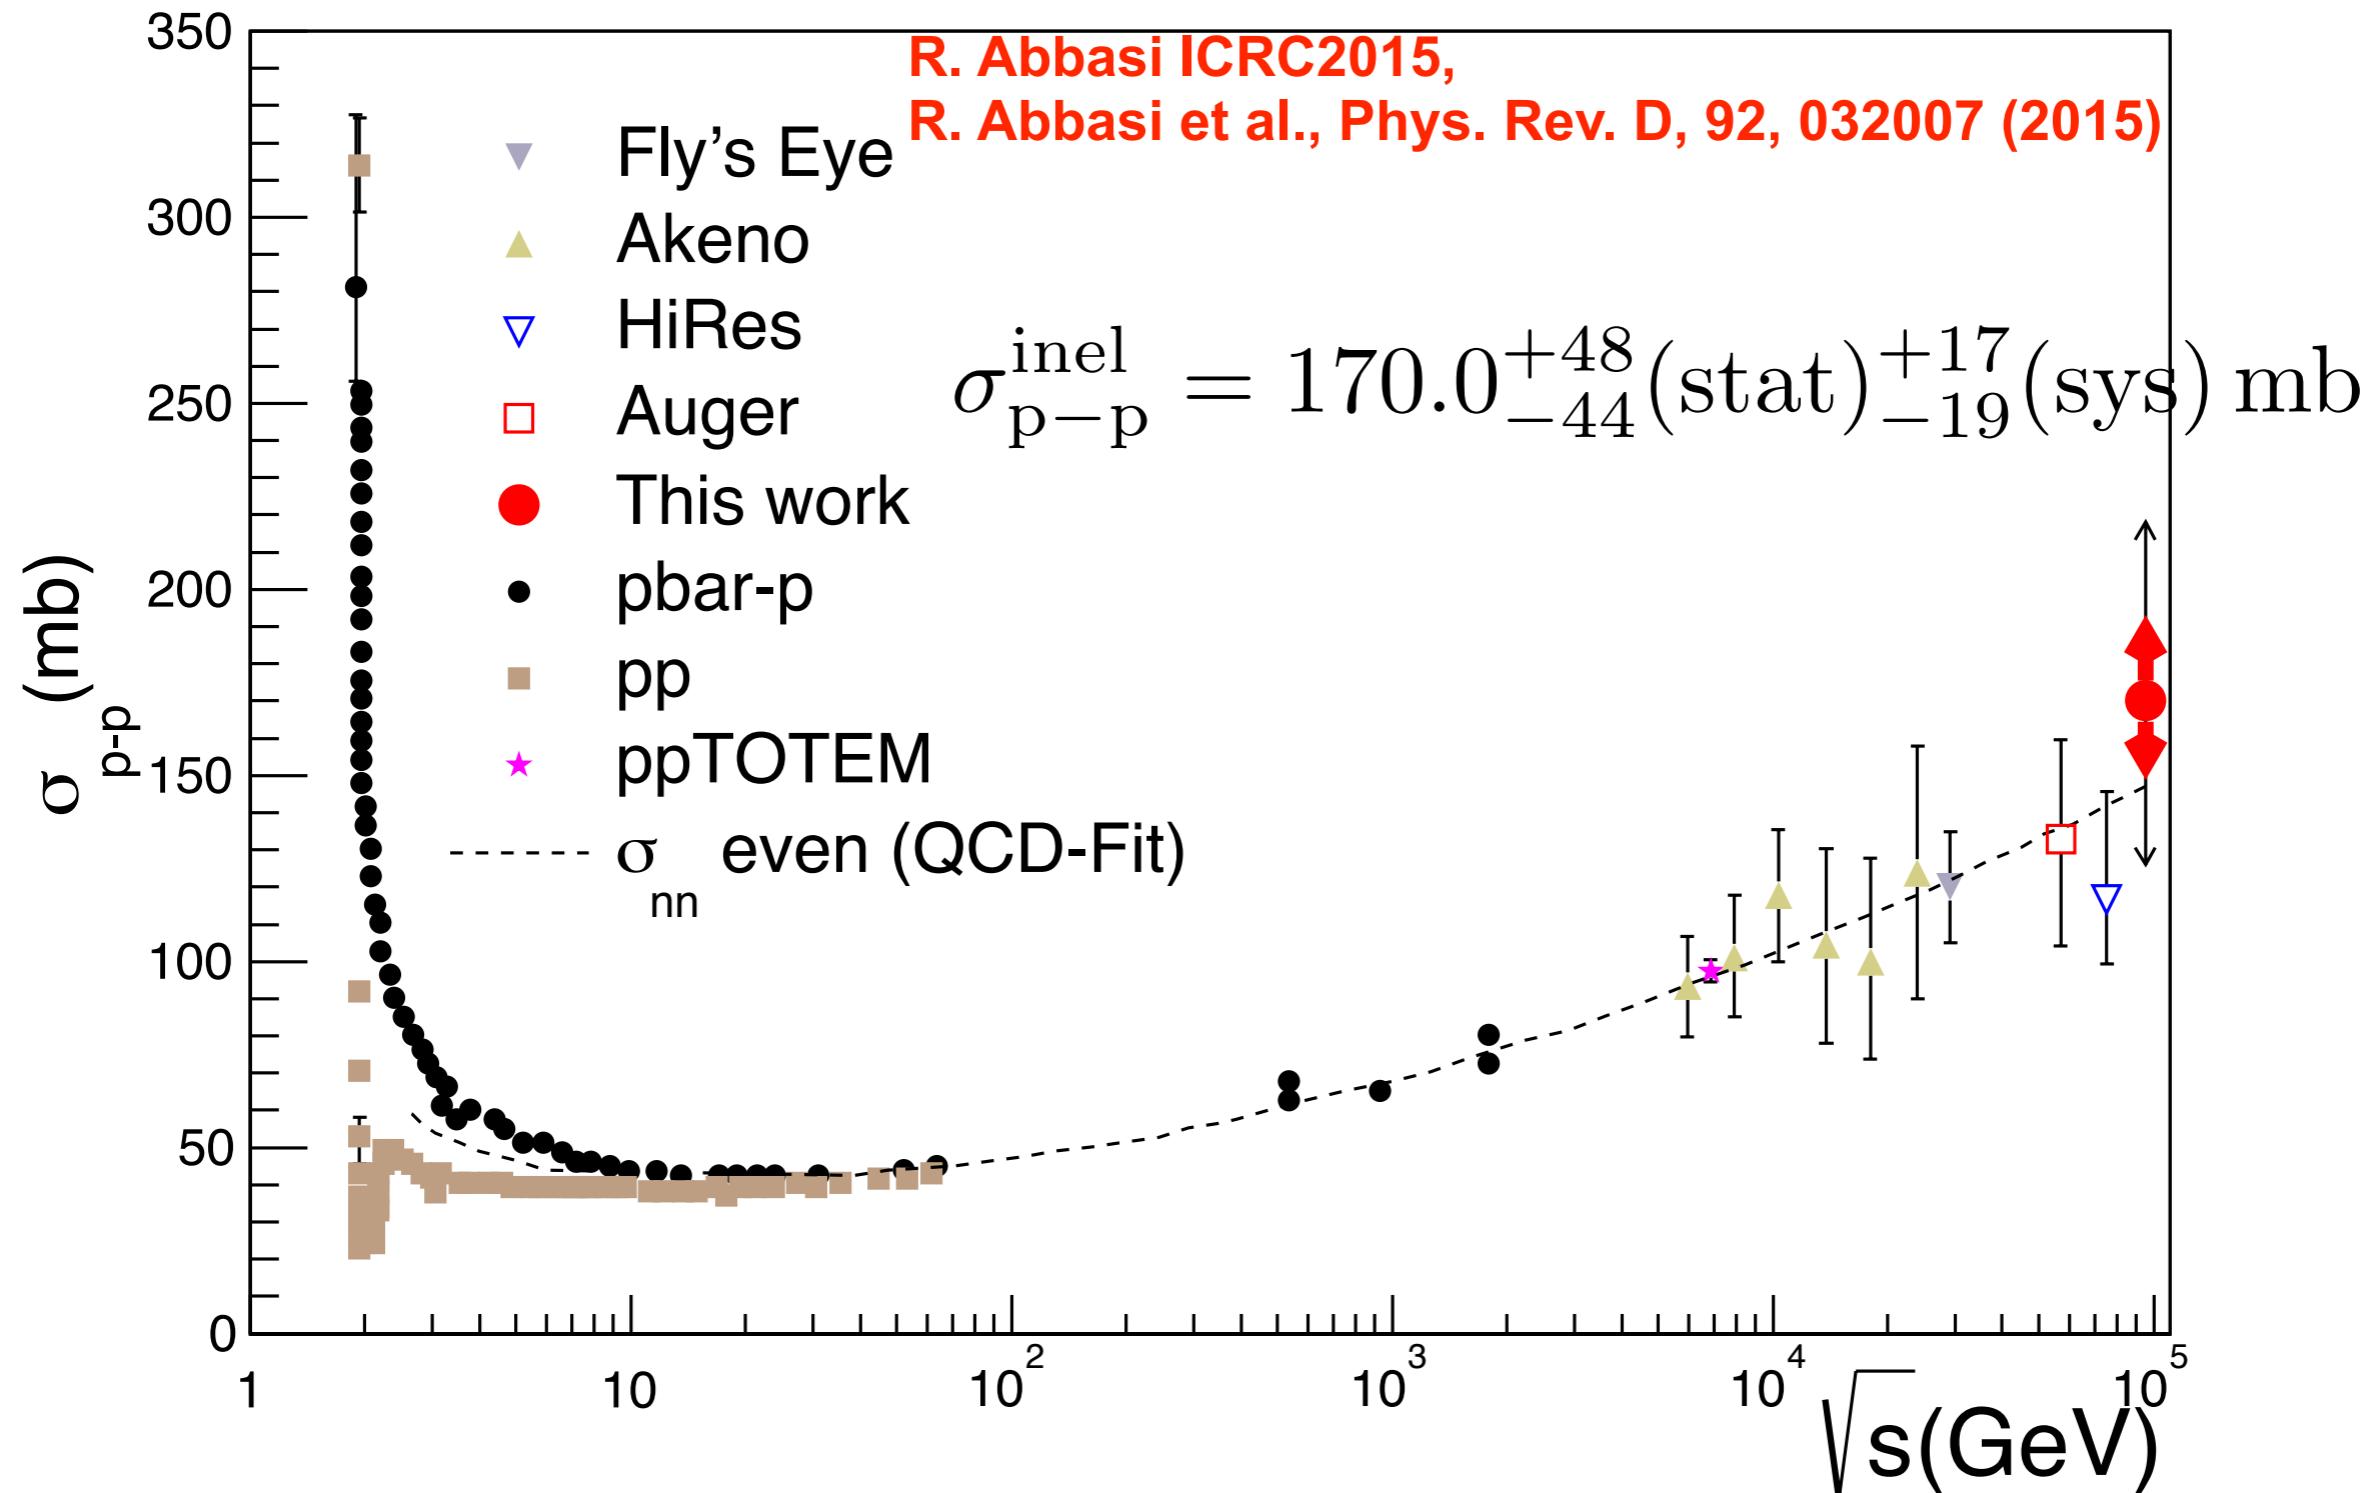

# p-Air Cross Section and Systematic Uncertainty

R. Abbasi ICRC2015,  
R. Abbasi et al., Phys. Rev. D, 92, 032007 (2015)

Systematic source	Systematic (mb)
Model Dependence	$\pm 17$
10% Helium	+9
20% Helium	+18
50% Helium	+42
Gamma < 1%*	-23
Total (20% He)	(+25,-29)

# p-p Cross Section by the Glauber Formalism

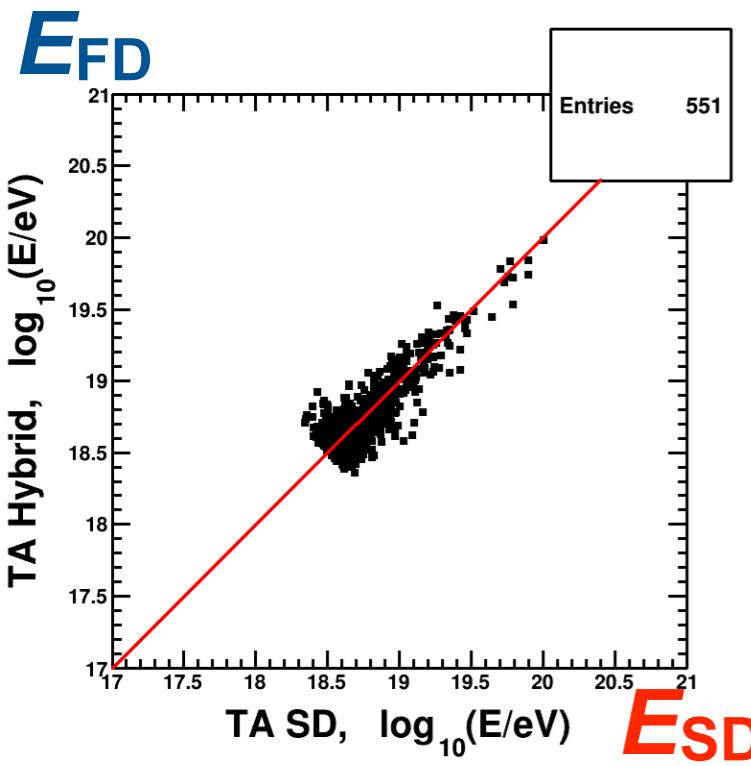

# Summary

- 7-year TA data
- Xmaxs analysis
  - MD and BR/LR analysis
  - Agreement with “light” composition with systematic uncertainties
    - $\langle X_{\text{max}} \rangle$  agrees with Auger
    - $X_{\text{max}}$  distributions support light composition
    - Statistics still limited in higher energies
- Cross section measurement
  - $\Lambda$ , the slope of  $X_{\text{max}}$  distribution
  - Use the “k” parameter to obtain  $\lambda \propto 1/\sigma$

$$\sigma_{\text{p-Air}}^{\text{inel}} = 567.0 \pm 70.5(\text{stat})^{+25}_{-29}(\text{sys}) \text{ mb}$$

$$\sigma_{\text{p-p}}^{\text{inel}} = 170.0^{+48}_{-44}(\text{stat})^{+17}_{-19}(\text{sys}) \text{ mb}$$

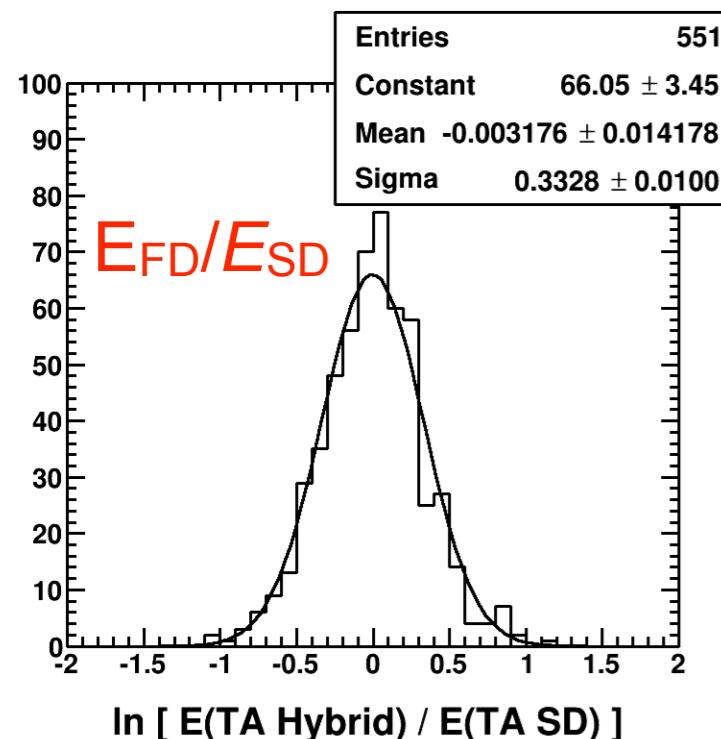

# Energy Determination in TA

- Use *hybrid* events, and calculate  $E_{\text{FD}}$  and  $E'_{\text{SD}}$ .
- Use  $E_{\text{FD}}$  as reference: calorimetrically determined energy
- Calculate  $E'_{\text{SD}}/E_{\text{FD}}$  ratio for the hybrid events

$$\left\langle \frac{E'_{\text{SD}}}{E_{\text{FD}}} \right\rangle_{\text{hyb}} = 1.27$$

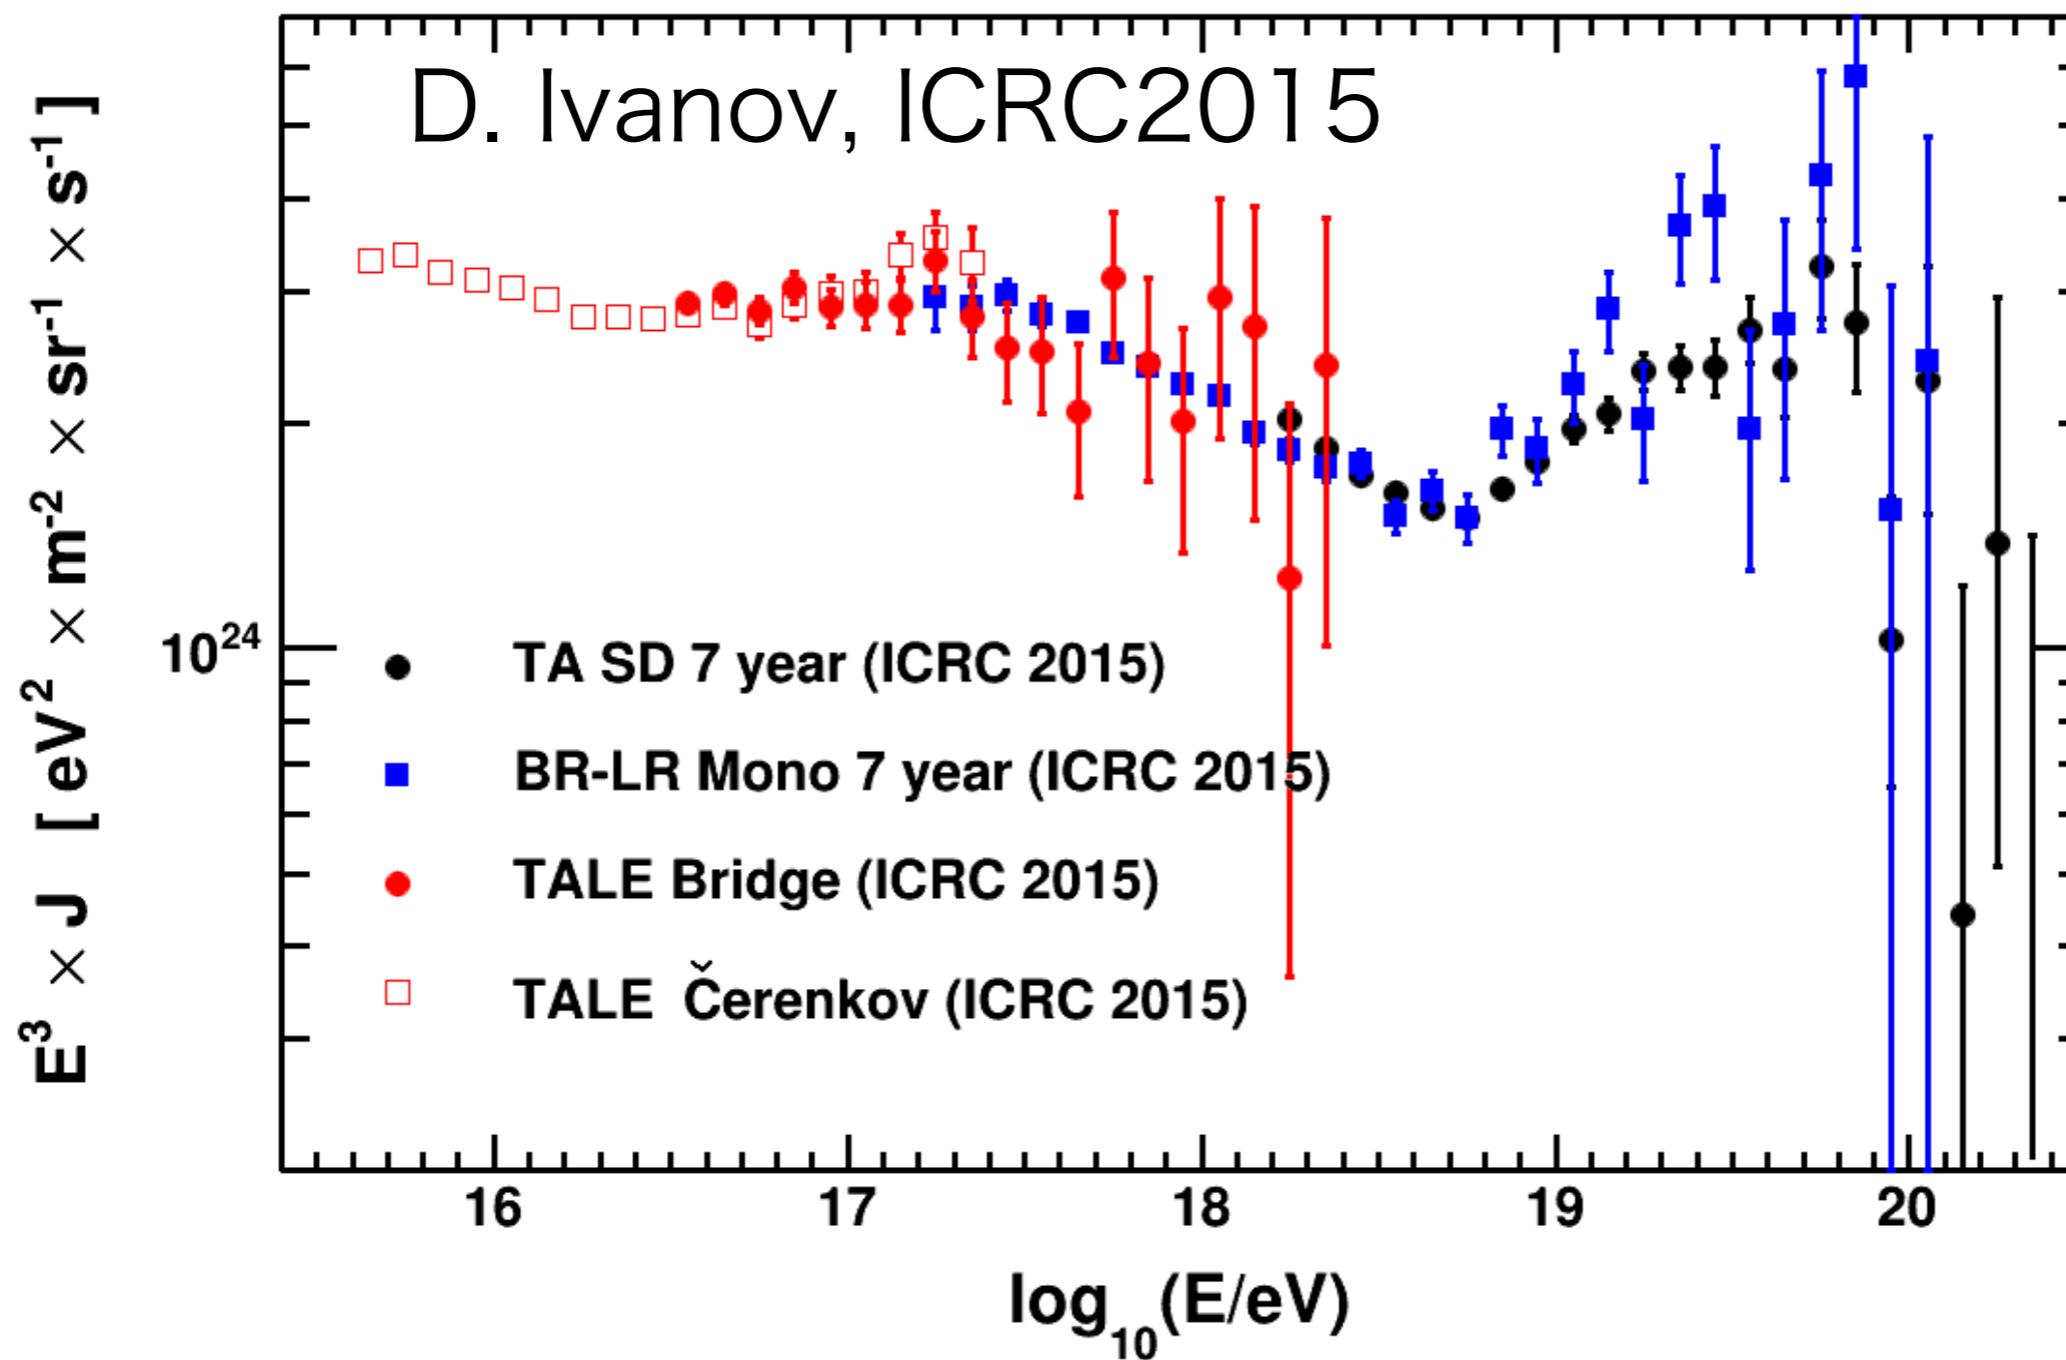

- Rescale the SD energy for all the SD events

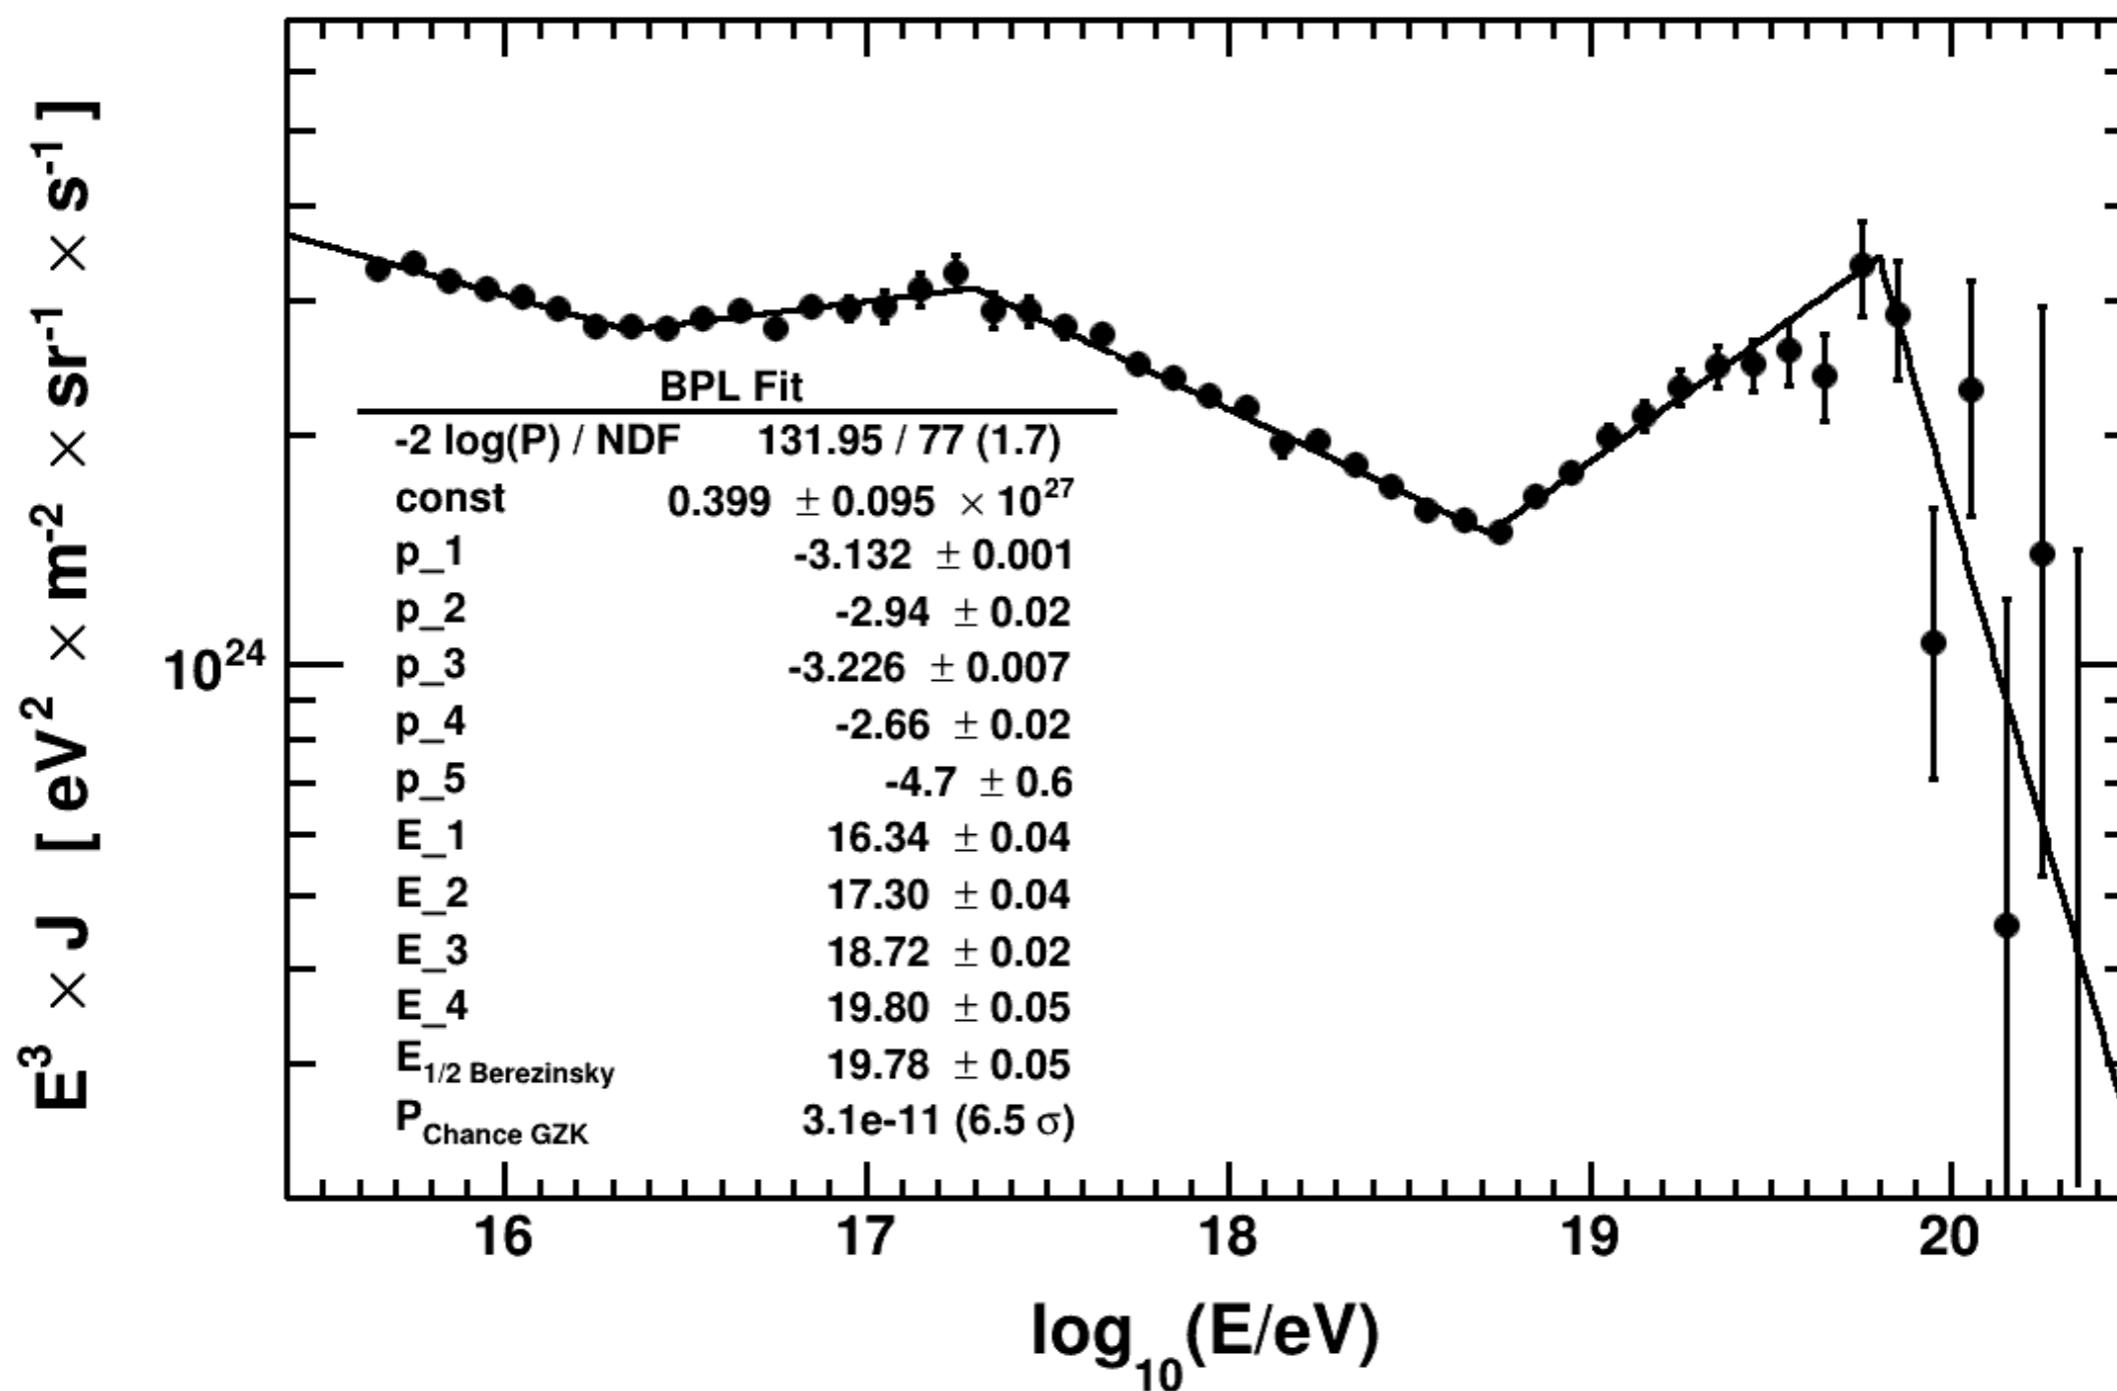

$$E_{\text{SD}} = \frac{1}{\left\langle \frac{E'_{\text{SD}}}{E_{\text{FD}}} \right\rangle_{\text{hyb}}} E'_{\text{SD}}$$

# TA 4.7-Decade Spectra

# TALE: TA Low-Energy Extension

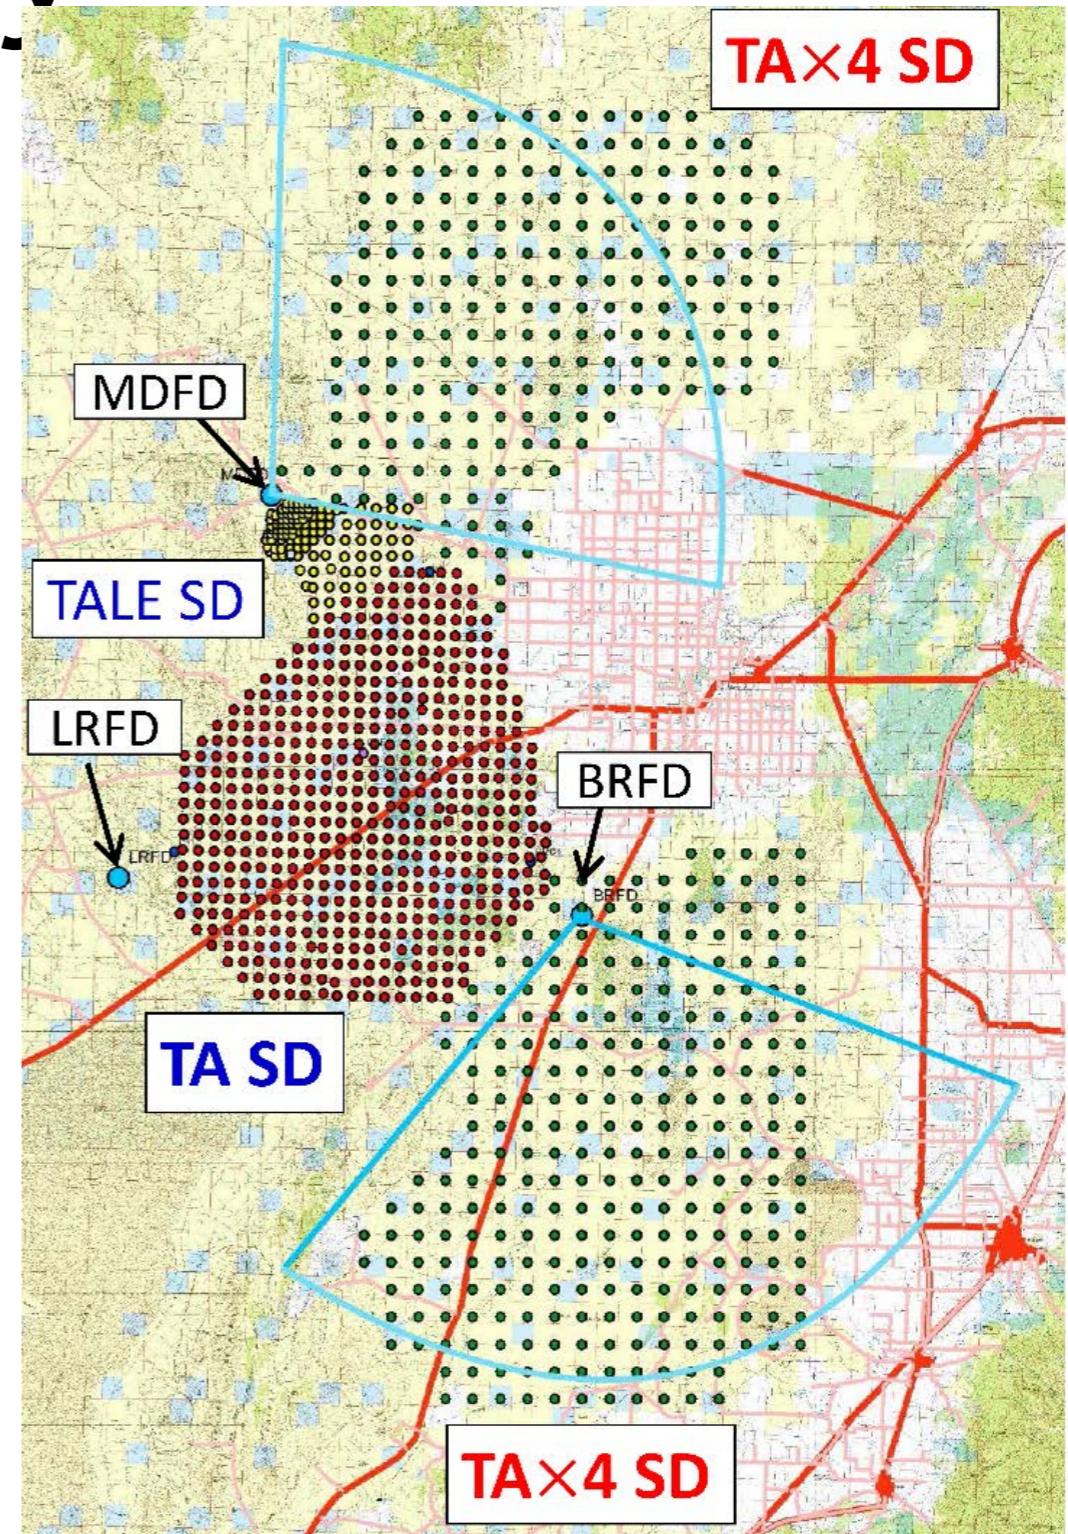

- Study the  $10^{16}$  and  $10^{17}$  eV decades with a hybrid detector.
  - End of the rigidity-dependent cutoff that starts with the knee (at  $3 \times 10^{15}$  eV).
  - The second knee
  - The galactic-extragalactic transition
- High energy physics measurements:
  - $\sigma(p\text{-air})$  and  $\sigma(p\text{-p})$  from LHC energy ( $10^{17}$ ) to  $10^{19}$  eV.
- Need to observe from  $3 \times 10^{16}$  eV to  $3 \times 10^{20}$  eV all in one experiment. That is TA and TALE.

# TAx4: Enlarging the TA SD Array

H. Sagawa, ICRC2015

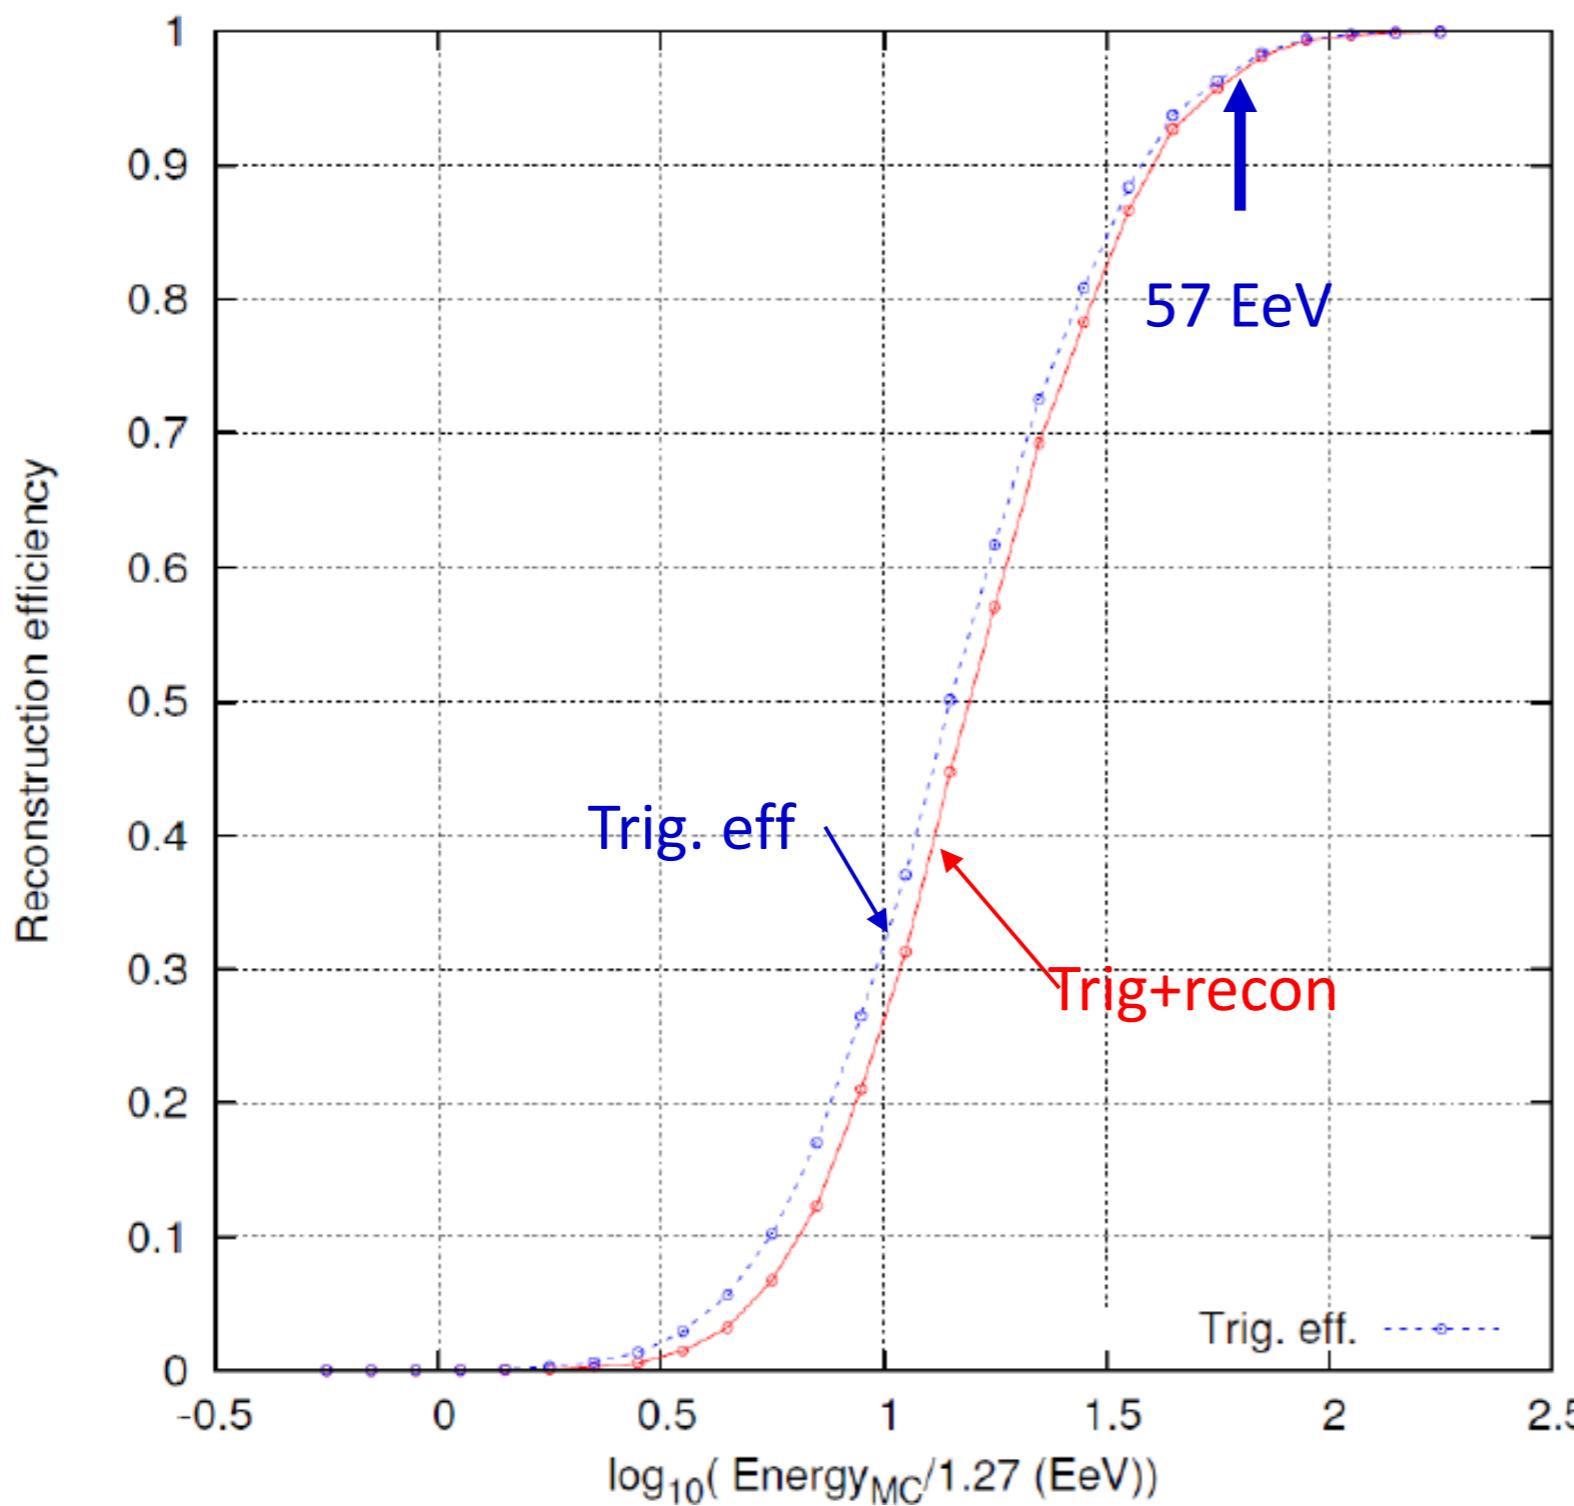

- Quadrule TA SD ( $\sim 3000 \text{ km}^2$ )
  - 500 scintillator SDs
  - 2.08 km spacing
- 2 FD stations
- Proposals
  - SD: approved in Japan in April 2015
  - FD: submit in US in October 2015
- Get 19 TA years of SD data by 2010
- Get 16.3 TA years of hybrid data
  - 2.7-year construction
    - TA in operation
  - 2.3-year observation

# TAx4 Detection

## Efficiencies

H. Sagawa, ICRC2015

Trigger condition

- . 3 MIPS
- . 3-fold SDs
- .  $< 8 \times 2.08/1.2 \text{ usec}$

Reconstruction

- .  $\text{NSD} \geq 4$

TA SD reconstruction  
efficiency = 100% for  
 $E > 10^{19} \text{ eV}$
