Introduction Genus Expansion Asymptotic Freeness

Freeness Second-order freeness

Definition

Families of matrices are asymptotically real second-order free if they are asymptotically free, have a second-order limit distribution, and for A_i and B_i in algebras generated by cyclically alternating families

$$\lim_{N\to\infty}k_2\left(\mathrm{Tr}\left(\mathring{A}_1\cdots\mathring{A}_p\right),\mathrm{Tr}\left(\mathring{B}_1\cdots\mathring{B}_q\right)\right)$$

vanishes when $p \neq q$, and when p = q, is equal to

$$\lim_{N \to \infty} k_2 \left(\operatorname{Tr} \left(\mathring{A}_1 \cdots \mathring{A}_p \right), \operatorname{Tr} \left(\mathring{B}_1 \cdots \mathring{B}_p \right) \right)$$
$$= \sum_{k=0}^{p-1} \prod_{i=1}^p \left(\lim_{N \to \infty} \left(\mathbb{E} \left(\operatorname{tr} \left(A_i B_{k-i} \right) \right) - \mathbb{E} \left(\operatorname{tr} \left(A_i \right) \right) \mathbb{E} \left(\operatorname{tr} \left(B_{k-i} \right) \right) \right) \right)$$
$$+ \sum_{k=0}^{p-1} \prod_{i=1}^p \left(\lim_{N \to \infty} \left(\mathbb{E} \left(\operatorname{tr} \left(A_i B_{k+i}^T \right) \right) - \mathbb{E} \left(\operatorname{tr} \left(A_i \right) \right) \mathbb{E} \left(\operatorname{tr} \left(B_{k+i}^T \right) \right) \right) \right)$$

A (1) > A (1) > A

Definition

Subalgebras A_1, \ldots, A_n of a second-order noncommutative probability space $(A, \varphi_1, \varphi_2)$ are *real second-order free* if they are free and for a_1, \ldots, a_p and b_1, \ldots, b_q centred and either cyclically alternating or consisting of a single term

$$\varphi_2(a_1\cdots a_p,b_1\cdots b_q)=0$$

when $p \neq q$ and

$$\varphi_2(a_1\cdots a_p, b_1\cdots b_p) = \sum_{k=0}^{p-1}\prod_{i=1}^p \varphi_1(a_i b_{k-i}) + \sum_{k=0}^{p-1}\prod_{i=1}^p \varphi_1(a_i b_{k+i}^t).$$
