Jet substructure for everyone

Gregory Soyez

IPhT, CNRS, CEA Saclay

Jets and their substructure from LHC data, May 31-June 4 2021, CERN (online)

In the early 2000-2010's: Jet substructure was a niche

(I would have had to explain what it is and why it is interesting)

In the early 2000-2010's: Jet substructure was a niche (I would have had to explain what it is and why it is interesting)

In the early 2000-2010's: Jet substructure was a niche (I would have had to explain what it is and why it is interesting)

In the early 2000-2010's: Jet substructure was a niche

(I would have had to explain what it is and why it is interesting)

In the early 2000-2010's: Jet substructure was a niche

(I would have had to explain what it is and why it is interesting)

substructure \equiv internal dynamics of jets

Before getting into applications, a few words about HOW it is done (excluding ML)

Two main classes of approaches for jet clustering:

- **1** Jets as particle branchings \rightarrow pairwise clustering ((anti-) k_t , C/A, ...)
- 2 Jets as energy flows \rightarrow cone algorithms (SISCone, MidPoint, ...)

Two main classes of approaches for jet clustering:

- **1** Jets as particle branchings \rightarrow pairwise clustering ((anti-) k_t , C/A, ...)
- **2** Jets as energy flows \rightarrow cone algorithms (SISCone, MidPoint, ...)

The same broad classes apply to substructure:

- ${f 0}$ Use particle branchings ightarrow techniques based on de-clustering the jet
- **2** Use energy flows \rightarrow techniques based on (sub)jet shapes

	(modified) MassDrop Tagger	(generalised) angularities	
(recursive) SoftDrop	Trimming		N-subjettiness
Pruning		Energy Correlation	
JH Top tagger	Shower deconstruct ⁿ	Functions	Energy flow Polynomials
Lund Plane	HEP Top tagger	Jet Pull	

* Non-exhaustive/biased/... list

CERN Jets 2021 5 / 32

A decade of substructure tools

A decade of substructure tools

[P.komiske, E.Metodiev, J.Thaler, 1712.07124]

Energy-flow polynomials

$$\mathsf{EFP}_G(\mathsf{jet}\;j) = \sum_{i_1,\ldots,i_N \in j} z_{i_1} \ldots z_{i_N} \sum_{(k,l) \in G} \theta_{i_k i_l}$$

with G a (multi)graph with N vertices and some edges (k, l)

Main properties:

- linear basis for IRC-safe substructure observables
- includes energy-correlation function: $\sum_{i,j} z_i z_j \theta_{ij}^{\beta}$ (and higher-orders) widely used for tagging
- Can be used for various ML tagging applications
- Interesting underlying computational structures

Cambridge/Aachen: iteratively recombine the closest pair

(iteratively) undo clusterings (following hard branch) to find structure (SoftDrop,...)
 study kinematic properties of the branchings (LundPlane)

Lund Plane representations

[F.Dreyer, G.P.Salam, GS, 1807.04758]

- C/A mimics angular ordering
- structure close to the Lund diagrams used in resummation/MC

Properties at each vertex $\mathcal{T}_i = \{\theta_i \equiv \Delta_i, k_{t,i}, z_i, \varphi_i, \dots\}$

Either primary only: $\mathcal{L}_{\text{prim}}(j) = [\mathcal{T}_1, \dots, \mathcal{T}_n]_{\text{primary}}$

Or full tree $\mathcal{L}_{\text{tree}}(j) = [\mathcal{T}_{j \rightarrow j_1, j_2}, \\ \mathcal{L}_{\text{tree}}(j_1), \mathcal{L}_{\text{tree}}(j_2)]$

Lund plane physics regions

Different physics contributions in different regions of the (primary) Lund plane

In particular, selecting $k_t \ge k_{t,cut}$ selects a pQCD region (IRC safety)

Lund plane physics regions

Different physics contributions in different regions of the (primary) Lund plane

In particular, selecting $k_t \ge k_{t,cut}$ selects a pQCD region (IRC safety)

Simple observable

Lund plane density:

$$\rho = \frac{1}{N_{\rm jet}} \frac{d^2 N}{d \ln 1 / \Delta d \ln k_t}$$

Lund plane physics regions

Different physics contributions in different regions of the (primary) Lund plane

In particular, selecting $k_t \ge k_{t,cut}$ selects a pQCD region (IRC safety)

Simple observable

Lund plane density:

$$\rho = \frac{1}{N_{\rm jet}} \frac{d^2 N}{d \ln 1 / \Delta d \ln k_t}$$

Prospect: trees & *E* flows are not exclusive: we can define flow/shape observables on tree constructions

Gregory Soye

Jet substructure for everyone

CERN Jets 2021 9 / 32

New and exciting progress

In a nutshell: for a few big applications of substructure I will

- Describe the physical idea (phrasing it in the Lund Plane picture)
- **2** Give (at least one) interesting recent development
- Oiscuss potential new developments

New prospects at the LHC

Searches and measurements

(now-gone) di-boson "excess" (end of Run-I)

analytic pQCD and ML for W tagging

Maximise background rejection for given signal efficiency

< □ > < □ > < □ > < □ > < □ > < □ >

analytic pQCD and ML for W tagging

Maximise background rejection for given signal efficiency

- Including all (primary) declusterings help [F.Dreyer,G.Salam,GS,1807.04758]
- ML can extract some additional information (~ ParticleNet w smaller cost [Gregor's])
- clear gain including the full tree [F.Dreyer,H.Qu,2012.08526]

Gregory Soye

Jet substructure for everyone

CERN Jets 2021 15 / 32

analytic pQCD and ML for q/g discrimination

Analytic pQCD and ML for q/g discrimination

If we increase the Boost (fixing $\alpha_s \log(p_t/k_{t,min})$ the gap between analytic and ML closes

- Great validation
- Question: extra information used by ML?
- Question: MC accuracy? is that extra information well-described in MC?

Use a sample with exact LL angular ordering $^{(\ast)}$ and compare analytics to ML

Shows very good agreement

(*) [F.Dreyer, M.Dasgupta, G.Salam, GS, 1411.5182]

∃ >

Performance v. resilience

A D N A B N A B N A B N

CERN Jets 2021 19 / 32

Performance v. resilience

• Generic trade-off between discriminating power and resilience

- ML gain mostly at small k_t where modelling more important
- some ML gain at larger k_t . Accessible in pQCD?

Tagging progress is (mostly) ML-oriented today

There are nonetheless some interesting directions where "QCD" can help

- Improved inputs/architecture
 Better control, faster convergence,...
- QCD analytics can be used as a validation of ML in known limits
- Trade-off between performance and "resilience"
- Room for "simple" QCD-based taggers (like the above Lund-plane, or arXiv:2006.10480)

More in Gregor&Jesse'talks (ML) and in Jack's talk (analytics)

New prospects at the LHC

э

A D N A B N A B N A B N

- What: compute substructure observables in pQCD
- Why: gain understanding on tools, compare to data, ...
- How: substructure often probes physics at scales \ll jet $p_t \rightarrow$ need for resummation
 - from "standard" QCD and SCET
 - State-of-the-art: NLL (or NNLL) matched to NLO
 - intimate link with Parton Showers (more on this later)
- A nice benefit: "groom" soft & large-angle radiation
 - makes calculations somewhat easier (mostly collinear physics)
 - reduced non-perturbative effects, pushed them to lower scales

Analytics for precision

- Regions dominated by either NP, resummation or fixed-order
- Unique framework for new probes of QCD over several scales
- Question: does substructure help for α_s or PDF extraction?
- See e.g. 1711.08341, 1603.09338, 1704.02210, 1712.05105, 1807.05974, 2104.06920, CMS-PAS-SMP-20-010

More in Andrew, Ian and Jack's talks

Analytics for precision

- Regions dominated by either NP, resummation or fixed-order
- Unique framework for new probes of QCD over several scales
- Question: does substructure help for α_s or PDF extraction?
- Prospect: study more complicated/differential quantities

Better constraints \Rightarrow less modelling uncert. \Rightarrow improved searches

rom		107

Versatile tool for future developments

Tweak the tool to match your needs

Connection with precision calculation

Example: Energy³ Correlation functions sensitive to spin correlations at NLL

See Ian's talk

< 1 k

-

Take-home messages

- Substructure is now mainstream and is here to stay
- Wide range of applications (Taggers, pQCD, HI, MC, ML)
- Active exploration ground/laboratory for QCD, exploiting the large phase-space offered by the LHC

Looking towards the future

- Expect more analyses with boosted jets
- Recent (and on-going) deep-learning revolution
- Need more calculations & (unfolded) substructure measurements
- Lots to do in substructure-based QGP studies
- Almost endless possibilities to test ideas/MCs/...
